                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs existing in human genes and for the diagnosis of human disease. The present DNA sequence represents a human gene PCR primer of the invention.
                                                                                                                                                                                                                                                                       Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.

This oligonucleotide was designed to amplify the region of homology in the kinase domains of PDGF receptor, HER2, HER3, FGF-FIG, FGF-BEK, insulin receptor and IRR. It was used with another kinase homology domain—based primer (see AAV05313) in the amplification of human LIM-kinase 1 (LIMK1) sequences. The LIMK1 gene is composed of 16 exons (see AAV05315 and AAT9559-T99629) and is located 15.4 kb 3' of elastin in chromosome 7. It encodes a novel protein kinase (see AAM46576). Williams syndrome cognitive profile (WSCP) is detected by determining zygosity of the LIMK1 locus, with hemizygosity being indicative of impaired visuo-spatial constructive cognition. Chromosome 7 deletion analysis allows discrimination between WSCP, SVAS (supra-vascular aortic stenosis) and Williams syndrome
                                                                                                                                                                                                 Diagnosing Williams syndrome cognitive profile from hemi-zygosity of LIMX1 - gene on chromosome 7 encoding new kinase, allowing differentiation from classic Williams syndrome and supra-vascular aortic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

                                                               This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, harper-E. The products of the invention have abortive and contraceptive activity and can be used for generacy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenacially. This sequence repersents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein B, hPAPPE. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPPE is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, harper. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the
the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, hpapp-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the artibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                  PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

CC perfect match, perfect mismatch, antisense mismatch.

CC perfect match perfect mismatch, antisense mismatch.

CC perfect match perfect mismatch, antisense mismatch.

CC perfect match perfect mismatch, antisense mismatch.

CC in monitoring gene expression levels by hybridisation to a DNA library, in monitoring gene expression levels by hybridisation to a DNA library,

CC compounds. The nucleic acid probes are specifically designed for analysis of the nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid comparises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross species comparisen. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acid mismapping the 5' termini of mRNA molecules by mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or an screening onny or genomic libraries or subclones conclaining segments of DNA that have been conclained and previously sequenced. The sequence greated is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly conclained in electronic format directly the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of taglabelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of thybridisation are least two or more nucleic acids to at least two or more nucleic acids probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Bach of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dot-probes is useful in in situ hybridisation, in Southern, Northern or dot-mutations of any gene, in mapping the 5' termini of mRNA molecules by prime extensions or in screening cond or the probes of supplementations of any gene, in mapping the 5' termini of mRNA molecules by the proper sequence or specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   primer extensions or in screening CDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been taclated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

```
complementary to particular genes, and can be used as probes for a variety of analyses such as gene expression analysis. Each probe comprises 9 or more consecutive nucleotides from at least one of 14936 nucleotide sequences defined in the patent, or their perfect sense match. The patent, or their perfect sense match. Sense mismatch oligomucleotides. The probes may be used in an array comprising at least 10 distinct nucleic acid probes. The array is useful in monitoring gene expression levels by hybridisation to a DNA library, in analysing genetic variations, and in hybridisation tagellabelled compounds. The probes are useful for identifying family members of a gene. The probes are useful in in situ hybridisations, in screening cDNA or genomic libraries (or derived subclones) for additional clones containing segments of DNA that have been previously isolated and sequenced, in Southern, northern, or dot-blot hybridisation of genomic DNA to identify or detect the sequence of any gene or detect specific mutations in any gene, and in mapping the 5' termini of mRNA molecules by primer extensions. The nucleic acid sequences of the invention are also useful as PCR primers. The invention provides a large collection of nucleic acid sequences complementary to particular genes with a wide range of analytical uses. ACH65260 represent the target equences of the invention. Note:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New probe array useful e.g. for monitoring gene expression levels, for analyzing genetic variations, or for hybridizing tag-labeled compounds, comprises multiple nucleic acid probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention relates to nucleic acid sequences that are complementary to particular genes, and can be used as probes for a variety of analyses such as gene expression analysis. Each probe comprises 9 or more consecutive nuclectides from at least one of 14936 nucleotide sequences defined in the patent, or their perfect sense match, antisense match or antisense mismatch oligonucleotides. The probes may be used in an array comprising at least 10 distinct nucleic acid probes. The array is useful in monitoring gene expression levels by hybridisation to a DNA library, in analysing genetic variations, and in hybridisations, in screening compounds. The probes are useful in in situ hybridisations, in screening cDNA or genemic libraries (or derived subclones) for additional clones containing segments of DNA that have been previously isolated and sequenced, in Southern, northern, or dot-blot hybridisation of genomic DNA to identify or detect the sequence of any gene or detect specific mutations in any gene, and in mapping the 5' termini of mRNA molecules by primer extensions. The nucleic acid sequences of the invention are also useful as PCR primers. The invention provides a large collection of nucleic acid sequences complementary to particular genes with a wide range of analytical uses. ACH50865-ACH65260 represent the target sequences of the invention. Note: The sequence data for this patent was obtained in electronic formatical and electronic provides a large of all party more in a party of the invention electronic formatical and electronic formatical and electronic electronic formatical and electronic electronic electronic electronic electronic formatical electronic elec

The invention relates to a method of designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction by aligning a first primer and a second primer. The method comprises: (a) aligning a first primer and a second primer; and (b) comprises: (a) aligning a first primer and a second primer; and (b) contain four or more bases that are perfectly matching to the 3' end does not contain seven or more bases that are perfectly matching contain four or more bases that are perfectly matching contain six or second primer, the first primer or more bases that are perfectly matching contain six or more bases that are perfectly matching to a sequence anywhere of the first primer or the second primer, the first primer or the second primer. The method is used to sequence anywhere of the first primer or the second primer. The method is useful for designing primer or the second primer. The method is useful for designing primer or the second primer. The method is useful for designing primer or the second primer. The method is useful for designing primer or the second primer. The method is useful for designing primer or the second contain of target DNA fragments in a single multiplex polymerase contain reaction. It is also useful in the identification of multiple genes contain the primer of the designing primer or the denotyping the primer or the second primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              alterations, the studies in pharmacogenetic reactions, the genotyping genetic polymorphisms in a large population, the gene expression profiling in various samples and high throughput genotyping technologies. This sequence corresponds to an example of a primer of the invention.

Single multiplex PCR primer #277.

15-JUL-2004 (first entry)

```
The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the haemoglobin gamma G gene located at chromosomal position 11p15.5. The sequence is amplified by primers AAT66094-5. (Updated on 25-MAR-2003 to correct PF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

                                                                                                                                                                                                                                                                                                                                  The sequence is that of a bovine microsatellite sequence obtd, by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (ACI)1s and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program OFTTRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. This invention describes a novel method for obtaining DNA of unknown sequence flanking a single site of known sequence involves single site amplification of circular DNA template flanking a trarget DNA of known camplification of circular single sequence using a polymerase having strand displacement capability. The method is used for obtaining a particular target DNA sequence that can be useful as templates that contain entire single sequence repeat (SSR) alleles for amplification (GSA) procedures e.g. PCR or can be employed as molecular markers, e.g. in distinguishing between species, strains or varieties within species or identifying the presence of a disease condition. It also provides a marker for use in areas such as import and export regulation, variety and ecotype identification, marker condition. It also provides a marker for use in areas such as import and export regulation, variety and ecotype identification, marker condition. It also provides a marker for use in areas such as import and export regulation, variety and ecotype identification, expert sequences in sequence within a single stranded DNA template and flanking regions for these target sequences. It can also be used for e.g. for cloning cDNA or genomic DNA which flanks any known short target sequence. The present method can also be used to obtain entire coding regions of the present method can also be used to obtain entire coding regions of the present method can also be used to obtain entire coding regions of the present method can also be used to obtain entire coding regions of the present method so also be used to obtain entire coding regions of the present method so also be used to obtain entire coding regions of the present method so also be used to obtain entire coding a degenerate
                                                                                                                                                                                                                                                                                                ö
designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Obtaining unknown DNA sequence flanking a single known sequence for use as PCR templates, involves single site amplification with polymerase having strand displacement capability.
                                                                                                                                                                                                                                                                                                Gaps

```
using a polymerase having strand displacement capability which can synthesize up to 10 kb fragments. This is especially useful for obtaining plant genes which are usually less than 10 kb in length. The method allows accelerated development of high resolution DNA markers that may be used for fingerprinting, mapping etc., using small amounts of tissue (less than 1 mmg). It also allows the production of a PCR template with knowledge of only one region of target DNA sequence, the size of which is regulated only by the primer design. The present method also eliminates genomic DNA library preparation and screening which are the most time consuming steps, typically requiring no less than three months, with total time for target DNA development being between 4-6 months, with total time for target DNA development being between 4-6 months.                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for obtaining DNA of unknown sequence flanking a single site of known sequence involves single site amplification of circular DNA template flanking a target DNA of known sequence using a polymerase having strand displacement capability. The method is used for obtaining a particular target DNA sequence that can useful as templates that contain entire simple sequence repeat (SSR) alleles for amplification (SSA) procedures e.g. PCR or can be employed as molecular markers, e.g. in distinguishing between species, strains or varieties within species or identifying the presence of a disease condition. It also provides a marker for use in areas such as import and export regulation, variety and ecotype identification, marker development, forensic DNA fingerprinting, etc. The method can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Obtaining unknown DNA sequence flanking a single known sequence for use as PCR templates, involves single site amplification with polymerase having strand displacement capability.

trom one sequence within a single stranded DNA template and flanking cregions for these target sequences. It can also be used for e.g. for cloning cDNA or genomic DNA which flanks any known short target sequence. To cloning cDNA or genomic DNA which flanks any known short target sequence. The present method can also be used to obtain entire coding regions of genes based upon a known nucleic acid sequence or by using a degenerate nucleic acid sequence derived from amino acid sequence back translation using a polymerase having strand displacement capability which can using a polymerase having strand displacement capability which can using a polymerase having strand displacement capability which can using a polymerase usually less than 10 kb in length. The method allows accelerated development of high resolution DNA markers that may be used for fingerprinting, mapping etc., using small amounts of tissue the finally. It also allows the production of a PCR template with knowledge of only one region of target DNA sequence, the size of which is regulated only by the primer design. The present method also eliminates genomic DNA library preparation and screening which are the most time consuming steps, typically requiring no less than three months, with the time for target DNA development being between 4-6 months, with the time for target DNA development being between 4-6 months, with 8X88888888888888888888888888888888

Composition for modulating transcription or replication of a pre-selected target sequence and for treating a plant or animal disease, comprises a recombinase and two probes, each containing a homology clamp and an anchoring sequence.

Disclosure, Fig 9, 103pp, English.

The present invention relates to a composition comprising a recombinase and two complementary single stranded probes each containing at least one homology clamp corresponding or complementary to a preselected target nucleic acid sequence and at least one anchoring sequence. The present sequence is a heterologous insert sequence used to generate the probes that can be used in the present invention. The composition of the present invention can be used to modulate transcription or replication of a pre-

selected target sequence, treat a disease state of a plant or animal caused by expression of a disease gene, detect a double stranded nucleic acid target sequence, isolate either strand of a double stranded target sequence, isolate either strand of a gene family, produce a transgenic non-human organism or plant, determine the function of a double stranded nucleic acid target sequence and inhibit double stranded nucleic acid target sequence and inhibit composition may be used to produce animal models for genetic defects 8888888888

Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

Example 1; Page 318; 408pp; English.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a complete card segment encoding (I). (I) can have antiposriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating poliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing prematurity and retinal detechment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in the promoter.

Example 6; Col 11; 13pp; English.

The invention relates to detecting (M1) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased expression of the gene. The method is used for detecting polymorphisms in a UGT gene promoter. (M1) is preferably a UGT 1 (UGTAH) gene promoter. (M1) is cusful for screening individuals for variation in glucuronidation activity, for optimising draw dosages for a patient, where the drugs cativity, for optimising are glucuronidated by UGT (preferably UGTAH) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter (UGTAH) gene promoter (UGTAH) gene promoter. Thus the DNA being amplified comprises all or part of in the promoter. Thus the DNA being amplified comprises all or part of the number of TA repeats is adetermined by a polymerase chain reaction and the number of five TA repeats (TA) 5, TAP, TAP, or sequencing the amplified DNA. The polymorphism comprises an allele consisting of five TA repeats (TA) 5, TAP, TAP, (TA) 6, (TA) 8, (TA) 6, (TA) 8, (TA) 6, (TA) 8, (

The invention relates to detecting (M1) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) repeats in the promoter, where the presence of the five The repeats correlates with increased expression of the gene. The method is used for detecting polymorphisms in useful for screening individuals for variation in glucuronidation a UGT gene promoter. (M1) is useful for screening individuals for variation in glucuronidation cativity, for optimising drug desages for a patient, where the drugs (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (preferably UGTA1) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter (UGTIA1) gene promoter. Thus the DNA and determining the number of TA repeats in determined by a polymerase allo repart of UGTIA1 promoter. The DNA is amplified by a polymerase chain reaction and the number of TA repeats is determined by gel electrophoresis or by sequencing the amplified DNA. The polymorphism comprises an allele
with expression of the UGT gene, and the individuals sensitivity to xenobiotics is effected by glucuronidation activity. The methods preferably involve determining the presence of five, six or seven TA repeats in the promoter. Defects in glucurodination is associated with Gilbert's syndrome (hyperbilirubinaemia) and Crigler-Najjar syndrome. The present sequence is the UGTIA1 promoter (TA)8 repeat region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ds; UGT1A1; promoter; Gilbert's syndrome; hyperbilirubinaemia;

consisting of five TA repeats (TA)5, six TA repeats (TA)6, or seven TA repeats (TA)7. The promoter has any one of the genotypes (TA)5, (TA)5, (TA)6, (TA)8, (TA)7, (TA)6, (TA)8, (TA)7, (TA)8, (TA)8, (TA)7, (TA)8 or TA)6, (TA)8, (TA)7, (TA)8 or TA)8 or TA)9 or TA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter. as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human uridine diphosphate glucuronosyltransferase gene polymorphism #15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting polymorphisms in uridine diphosphate glucuronosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; polymorphism; TA repeat; ds; UGT; thymidine-adenine repeat; uridine diphosphate glucuronosyltransferase gene promoter; UGT1A1; drug dosage optimisation; xenobiotic sensitivity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTIA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is useful in optimising drug desages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.

The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the ISSR-related PCR primer of the invention.
                                                                                                                                                                                                                                                              Gaps

The present invention describes a woulde-scribed wascular endothelial growth factor receptor (VBGFR) gene. Also described: (1) a single that downregulates the VBGFR) gene. Also described: (1) a single that downregulates the VBGF gene; (2) kits for in vitro or in vitro of single. Single-stranded single so is NA; (4) vectors that express single, and (5) single-stranded single so is NA; (4) vectors that express single, and is single-stranded single properties. The single hard properties. The single range of antidiabetic, nephrotropic and synacological, antiarthritic, antipsoriatic, nephrotropic and synacological, antiarthritic, antipsoriatic, nephrotropic and synacological, antiarthritic, antipsoriatic, nephrotropic and constitutes. The single are set in the single are potentially useful for treating a wide range of angiogenesis-associated conditions, useful for treating a wide range of angiogenesis-associated conditions, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiotibroma, and polycystic kidney disease. The sing may also be useful for diagnosis, and polycystic kidney disease. The sing may also be useful for diagnosis, chingle-nucleotide polymorphisms). The present sequence is used in the single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The siNh are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthitis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNh may also be useful for diagnosis, dung screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleic acid (sink) that downregulates expression of the vascular endothelial growth factor receptor (WEGFR) gene. Also described: (1) a sink that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNk; (3) conjugates and/or complexes of siNk; (4) vectors that express siNk; and (5) single-stranded siNk with similar properties. The siNks have antianglogenic, cytostatic, antidiabetic, ophthalmological, antiarbritic, antigeoriatic, nephrotropic and gynaecological activities. The siNk are useful for modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          double-stranded interfering nucleic acid, useful e.g. for treatment diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present invention describes a double-stranded short interfering
                                                              Human VEGFR3 short interfering nucleic acid (siNA) SEQ ID NO:1689
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

The present invention describes a double-stranded short interfering nucleic acid (siNh) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a sink that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNh; (3) conjugates and/or complexes of siNh; (4) vectors that express siNh; and (5) single-stranded siNh with similar properties. The siNhs have antiangiogenic, cytostatic, nephrotropic and opphrandlogical, antiarthritic, antipsoriatic, nephrotropic and gynaecological activities. The siNh are useful for modulating (downregulating) the expression of VEGFR genes. The siNh are potentially useful for treating a wide range of angiogenesis-associated conditions, necticularly cancers, alabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNh may also be useful for diagnosis,
                                                                                                                                                                                                                                    New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 3; SEQ ID NO 1923; 207pp; English.

delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidiabetic, antiabetic, opphthalmological, antiathritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the

```
The structure describes a contract structure of the vascular endothelial growth factor receptor (VBGFR) gene. Also described: (1) a sink that downregulates the VEGF gene; (2) kits for in vitro or in vitro and gradectic, antipaporiatic, nephrotropic and gradecological activities. The sinh are useful for modulating of downregulating) the expression of VEGFR genes. The sinh are potentially cuseful for treating a wide range of angiogenesis-associated conditions, particularly cancoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The sinh may also be useful for diagnosis, drug screening, target identification and validation, genetic or engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the
double-stranded interfering nucleic acid, useful e.g. for treatment diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                 present invention describes a double-stranded short interfering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 19 BP; 10 A; 9 C; 0 G; 0 T; 0 U; 0 Other;

Inspection of flat epithelial cell, screening of treating or preventive agents for flat epithelial cancers, the treating or preventive agents for flat epithelial cancer.

Example; Page 8; 18pp; Japanese.

The present invention describes a method for the inspection of flat epithelial cells in which it is judged that flat epithelial cells separated from an organism can proceed to flat epithelial cancer when the

2128th base in fibroblast growth factor receptor (FGFR) gene of the cells is mutated from guanine to thywine. Also described is a method for screening treating or preventive agents for flat epithelial cancers in which a candidate substance of treating agent for flat epithelial cancer is applied to flat epithelial cancer cells producing FGFR protein in which the 2128th (exon 17) amino acid in FGFR3 gene is mutated from guanine to thymine or the 697th amino acid is mutated from guanine to thymine or the 697th amino acid is selected by using the facts that the 2128th base in the flat epithelial cell FGFR3 gene after the application returned to guanine and that the 697th amino acid of FGFR3 protein produced returned to glycine as the indices. The method is used for the inspection of flat epithelial cells. The present sequence represents a mutagenesis primer for human FGFR3, which is used in an example from the present invention . 0 useful e.g. for treatment and down regulates expression of at least The present invention relates to a short interfering nucleic acid (siNA) that down regulates expression of at least one cyclin gene by RNA interference, siNA are used to modulate expression of cyclin genes, in. short interfering nucleic acid; siNA; cyclin; Cytostatic; Vasotropic; cancer; cell-proliferation disorder; restenosis; drug screening; genetic engineering; pharmacogenomics; gene mapping; single nucleotide polymorphisms; ss. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases froction and diagnosing and treating T-cell associated diseases graft versus host disease, Appersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, arrophic asstrictis. Degenerative nervous system diseases include sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to Goodpasture's syndrome and Type IV hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

This invention describes novel methods of producing double stranded nucleic acid molecules with a preselected value for a free energy parameter (e.g. a preselected T m or a preselected affinity for a nucleic acid binding ligand). The method involves preparing a first double card comprising a binding site for a nucleic acid.

List double stranded nucleic acid has a preselected relationship with a first reference value of a first free energy parameter for a reference double-stranded nucleic acid comprising a reference binding site for the light reference value of a first free energy parameter for a reference coupled in the first free energy parameter is a characteristic of the binding of a ligher than, equal to or lower than (sic). The method comprises: (a) determining a test value for a test double stranded nucleic acid, comprising a test value for a test double stranded concleic acid, comprising a test binding site for the ligand, of a second free energy parameter that is characteristic of the hybridization of the two complementary strands of double stranded nucleic acid, (b) comparing the first value to a reference value) of the cecond free energy parameter for the reference value) of the acid, and (c) if the test value and the second reference value of the
                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucing double stranded nucleic acid molecules with preselected values free energy parameters such as affinity for nucleic acid binding
fungal infections such as those caused by
             the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.

This invention describes novel methods of producing double stranded nucleic acid molecules with a preselected value for a free energy parameter (e.g. a preselected T m or a preselected affinity for a nucleic parameter led, a preselected T m or a preselected affinity for a nucleic serial binding ligand). The method involves preparing a first double stranded nucleic acid comprising a binding site for a nucleic acid first double stranded nucleic acid has a preselected relationship with a first reference value of a first free energy parameter for a reference consultable stranded nucleic acid comprising a reference binding site for the ligand. The first free energy parameter is a characteristic of the binding of a ligand of interest to its binding site and the preselected comprishonship is higher than, equal to or lower than (sic). The method comprises: (a) determining a test value for a test double stranded nucleic acid, comprisens the binding site for the ligand, of a second
                                                                                                                                                                                                                                                                                                                      ô
second free energy parameter exhibit a test relationship that is the same as the preselected relationship, then preparing a first double stranded nucleic acid comprising all or part of the test nucleic acid, but if the test relationship is different than the preselected relationship, repeating step (a) and (b) on one or more additional test double stranded nucleic acids until an additional test double stranded nucleic acid is identified in which the test relationship is the asme as the preselected relationship, and then preparing a first double stranded nucleic acid comprising all or part of the additional test nucleic acid. free energy parameter that is characteristic of the hybridization of the two complementary strands of double stranded nucleic acid; (b) comparing the first value to a reference value (second reference value) of the second free energy parameter for the reference double stranded nucleic acid; and (c) if the test value and the second reference value of the second free energy parameter exhibit a test relationship that is the same as the preselected relationship, then preparing a first double stranded nucleic acid comprising all or part of the test nucleic acid, but if the rest relationship is different than the preselected relationship.

The reparting step (a) and (b) on one or more additional test double stranded nucleic acid is identified in which the test relationship is the same as the preselected relationship, and then preparing a first double stranded nucleic acid is identified in which the part relationship is the same as the preselected relationship, and then preparing a first double stranded nucleic acid comprising all or part of the additional test nucleic acid. (ISIS-) ISIS PHARM INC

Cowsert LM; Mckay R, Butler MM, Wyatt J, WPI; 2001-190979/19. Antisense compound capable of modulating the expression of phosphoenol pyruvate carboxykinase-cytosolic, useful for preventing or delaying infection, inflammation or tumor formation.

Example 17; Col 44; 64pp; English.

30 nucleobases in length that are capable of inhibiting the expression of phosphoenol pyruvate carboxykinase-cytosolic (PEPCK-cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in calls or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or The present sequence is one of a number of antisense compounds of up to

The invention relates to a map of the bread wheat D genome comprising the genome location of a microsatellite marker selected from a group of 185 genome location of a microsatellite marker selected from a group of 185 genome location of MARQ92733-ARQ92737). The invention also encompasses the use of left (ARQ92181-ARQ93103) and right (ARQ93103-ARQ93287) primers to amplify and detect the microsatellite markers, and to identify genes responsible for a phenotypic trait of interest and to identify genes a location and allohexaploid species consisting of 3 diploid genomes designated A, B and allohexaploid species consisting of 3 diploid genomes designated A, B and D, resulting from two successive intercrossings involving at least three different species. The D genome is thought to have been introduced in the most recent intercrossing, between the amphipioid AABB and Triticum to both species. Due to its polypioid genome, the large size of its genome, and its low level of polymorphism, the genetic mapping of wheat has to date been difficult. Microsatellites are tandemly repeated sequences the mainly due to polymerase slippage during replication. This high degree of polymorphism makes them especially suitable for the genetic mapping of polymorphism makes them especially suitable for the genetic mapping of
                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Map of wheat D genome comprising the genome location of a microsatellite marker, useful for e.g. identifying genes responsible for a desired phenotypic trait, especially quantitative trait loci in wheat, and
delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a

species which show little intraspecies polymorphism, such as wheat. In addition, microsatellites are codominant, and exhibit Mendelian.

Inheritance. The 185 microsatellite markers of the invention are developed from the ancestral diploid donor species Triticum tauschii and map to the wheat D genome, which is less polymorphic than the A or B genomes. These microsatellite markers thus help to overcome some of the problems associated with the genetic mapping of wheat. The wheat D genome invention are useful for identifying genes responsible for a phenotypic trait of interest, most notably OTLs (quantitative trait loci). In particular they may be used for analysing genes and alleles implicated in glesses and for identifying development factors, quality factors and factors conferring resistance to pathogens and xenobiotics. The microsatellite markers and associated primers may be used in microsatellite markers and associated primers may be also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                              mapping and genotyping diploid and polyploid species of Triticum, particularly Aegilops, Triticum monococcum, Triticum durum, Triticum essetivum, or related species; for identifying cultivars and hybrids of Triticum and related species; to assess whether or not a product comprises wheat or a related species; and to assess whether or not a product comprises genetically modified wheat. The present sequence represents a specifically claimed Triticum tauschii/wheat genome D microsatellite marker right per primer of the invention. (Updated on 29-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human NADPH quinone oxidoreductase 2 (NQO2) polymorphic sequence #41.

This invention relates to the sequence of an isolated nucleic acid
molecule comprising at least one base variation from that of a known
molecule comprising at least one base variation from that of a known
the conforme P450 Al (CYP4501A1), Gyrochrome P450 A2 (CYP4501A2),
cytochrome P450 O2E1 (CYP4501DE1), adrenergic receptor betal (ADBR1),
aryl hydrocarbon (AHR), aryl bydrocarbon receptor nuclear translocator
(ARNT), cathepsin S (CTSS), cyclooxgenaes 2 (COX2), diazepam binding
inhibitor (DB1), epoxide hydroxylase 2 (EMX2), blipoxygenase activating
protein (ELAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
transferase (HNWT), NADPH quinone oxidoreductase 2 (NQO2)
transferase (HNWT), NADPH quinone oxidoreductase 2 (NQO2)
cransferase (HNWT), nathermolabile (STM), UDP-glucuronosyl transferase 2B1 (HGT2B7), UDP-glucuronosyl transferase 2B2 (HGT2B7), UDP-glucuronosyl
transferase (HTMT), actotransferrin (LTF), multidrug resistance associated protein 3
(MRR1), lactotransferrin (LTF), craceptor (LPRA2) (HRR4 or CHRR5) sequence
creeptor 1, 2, 3, 4, or 5 (CHRM1, CHRR2) (HRR4 or CHRR5) sequence
creeptor 1, 2, 3, 4, or 5 (CHRM1, CHRR2) (HRR4 or CHRR5) sequence
creeptor 1, 2, 3, 4, or 5 (CHRM1, CHRR2) (HRR4 or CHRR5) sequence
creeptor 1, 2, 3, 4, or 5 (CHRM1, CHRR2) (HRR5) (HRR5) sequence
creeptor 1, 2, 3, 4, or 5 (CHRM1, CHRR2) (HRR5) (HRR5) sequence
creeptor 1, 2, 3, 4, or 5 (CHRM1, CHRR2) (HRR5) (HRR5) sequence
creeptor 1, 2, 3, 4, or 5 (CHRM1, CHRR2) (HRR8) (HR
                                                                                                                                     Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     uscaptibility to colorectal tumours, in DBI or CHMR1 for altered central nervous system function, in FLAP and HNWT for altered pulmonary, immunological or haematological function, in KLK2 for altered serine protease activity in the prostate, in LTF for altered immunological or haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and peripheral nervous system function. The present sequence represents a

                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                            The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPB). The DNA sequences of the invention are useful for detecting SNPB existing in human genes and for the diagnosis of human disease. The present DNA sequence represents a human gene PCR primer of the invention.
                                                                                                                                                            Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs

transperson because a control and an entransperson of the compounds, the forest to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to human mPGES-1 genes compounds, gas-1.

Comparison as sequence compurising 8-10 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal comparison associated with mPGES-1. MPGES-1 and antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound to can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or condition, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

the present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGBS-1). The targeted to human microsomal prostaglandin E2 synthase (mPGBS-1). The human mPGBS-1 gene is located on chromosome 9, more specifically to gastan invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGBS-1, which specifically hybridise with the nucleic acid encoding mPGBS-1, which specifically hybridise with the nucleic acid encoding mPGBS-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGBS-1. MPGBS-1 chimeric antidabetic, immunomodulator, cardiant, neuroprotective, antidiametory, neuroprotective, antidiametory, neuroprotective, antidiametory, neuroprotective, antidiametory, neuroprotective, antidiametory, neuroprotective, antidiametory, neuroprotective, antiditors and cardiavascular activities, and can be used for preparing a composition for treating a disease or condition associated with mPGBS-1 entracting a disease or condition associated with mPGBS-1 entraction or can be used for preparation or can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                          New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present invention relates to measuring the copy number of a locus by amplifying and comparing test and reference loci. The invention is useful as diagnostic and prognostic tools and in correlating abnormal copy number values for specific loci with disease and effectiveness of different treatment options. The present sequence is a CA repeat fluorogenic probe used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Measuring copy number of a polynucleotide locus in sample useful as diagnostic and prognostic tool, comprises quantifying amount of test locus and reference loci in test and control subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    end attached to 6-carboxy fluorescein"

                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                      The invention relates to a compound targeted to a nucleic acid molecule encoding B7H, where the compound specifically hybridises with the nucleic acid molecule encoding B7H and inhibits the expression of B7H. The compound is useful for modulating the expression of B7H. It is also useful for diagnosing or treating diseases associated with expression of B7H, e.g. an autoimmune disease. The present sequence represents a mouse B7H antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a compound targeted to a nucleic acid molecule encoding B7H, where the compound specifically hybridises with the nucleic acid molecule encoding B7H and inhibits the expression of B7H.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (about 500 for testing for 21 specified disorders), so can be used for simultaneous testing for many diseases. Testing is quick, inexpensive. reliable and more sensitive than current physiological methods. AAH48868-AAH489166 represent oligonucleotides used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel nucleotide support (A; gene chip) which carries a selection of oligonucleotides (I) that are identical, or complementary, to segments of reference sequences relevant to at least two genetically determined phenotypes. (A) are used for simultaneous diagnosis of at least two of the following diseases: phenylketonuria deficiency, syrup diseases, galactosemia, homocysteinuria, biotinidase deficiency, medium-chain acyl-CoA-dehydrogense deficiency, familial hypercholesterolemia, familial defective apolipoprotein-B, cystic fibrosis, Marfan syndrome, Smith-Lemil-Opitz syndrome and androgenital syndrome. Specifically they are used in neonatal or prenatal diagnosis.

(A) require a relatively small number of separate hybridization regions
                                                                             phenylketonuria; maple syrup disease; galactosemia; homocysteinuria; medium-chain acyl-CoA-dehydrogenase deficiency; blotinidase deficiency; familial hyperxholesterolemia; familial defective apolipoprotein-B; cystic fibrosis; Marfan syndrome; Smith-Lemil-Opitz syndrome; androgenital syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                          DNA chip, useful for neonatal or prenatal screening for many genetic diseases simultaneously, carries oligonucleotides complementary to phenotypically relevant reference sequences.

This invention describes a novel method for determining the genetic risk of arteriosclerosis both for clinical diagnosis and for population studies. The method comprises: (i) selecting risk-associated reference contents and sequences, including their functionally characterizing mutations, (ii) applying probes from these sequences, or their complements, to a carrier; (iii) hybridising the probes with a nucleic acid from (or synthesised from) a patient sample, and (iv) detecting and evaluating the hybridisation pattern. The method provides a quick, inexpensive and informative diagnosis, and makes possible a contaction that when present alone carry no risk but are risk mutations or mutations that when present alone carry no risk but are risk associated in presence of other mutations. The results may be combined with known risk-assessment methods to provide a more reliable diagnosis, contaction and present methods (e.g. gene therapy) that are directed against specific genes. All relevant mutations in a contaction a single test and the method is well suited to automation. ABX09147-ABX09676 represent probes used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; ds; cytochrome P450 Al; CYP4501Al; UGT2B4; MDR1; cytochrome P450 A2; CYP4501A2; cytochrome P450 02E; CYP45002El; LTF; adrenergic receptor betal; ADBR1; aryl hydrocarbon; AHR; MRP3; NR112; aryl hydrocarbon receptor nuclear translocator; ARNT; cathepsin S; CTSS; cyclooxgenase 2; COX2; diazepam binding inhibitor; DBI; haematological; epoxide hydroxylaee 2; EPHX2; 5-lipoxygenase activating protein; FLAP; glutathione-S-transferase 12; GST12; histamine-N-methyl transferase;

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 28; Page 159; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cortochrome P450 Al (CYP4501A1), cytochrome P450 Al (CYP4501A1), aryl bydrocarbon receptor nuclear translocator cytochrome P450 02E1 (CYP4501A1), aryl bydrocarbon receptor nuclear translocator (ARNY), cathepain S (CYSS), cyclooxgenase 2 (COX2), diazepam binding inhibitor (DBI), epoxide hydroxylase 2 (EPHX2) 5-11poxygenase activating cytochrome P450 02E1 (ARNY), Lather and the control of transferase (HNWT), MADIPH quinnen oxidoreductase 2 (NQC2), histochrome P450 CC (UGT2B1), utokinase receptor (MPA), unperguence oxidoreductase 2 (NQC2), utokinase receptor (MPA), upp-glucuronosyl transferase (UGT2B1), utokinase receptor (MPA), upp-glucuronosyl transferase (UGT2B1), utokinase receptor (MPA), orphan nuclear receptor (MPA), or securing the disorder for locating and characterising the genes that creeptor (MPA) and the invention are useful as green in an individual for a useful or treating the disorders. The nucleic acid molecules comprising the companies of their e.g., overexpression, which may be used in disgnosing metabolism. The polymorphic sequences contained in CYPH501A1, CYPH501A1, CYPH501A1, CYPH501A1, CYPH501A1, CYPH501A1, CAMP, MDR, and/or MDR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences contained in CYPH501A1, CYPH501A1, CAMP, MDR, and/or MDR3 are useful for screening individual for altered drug metabolism. The polymorphic sequences cont polymorphic DNA sequence of the invention

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, and neoplastic disease. Avpersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple sclenosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclenosis and Alzheimer's disease. Hypersensitivity diseases include multiple in hypersensitivities such as contact with allergens that lead to

allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by

Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primers AAX34328-X34331 were used to PCR amplify the gene encoding a human brain-specific tyrosine kinase (Byk; AAX34327). The coding DNA can be used in drug applications, especially to detect a nervous skin syndrome (sic) related antigen
the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of human APT dependent membrane conjugated zinc proteinase 10.45. The sequences can be used in the treatment of developmental disturbances and lipid metabolism disease. The present sequence is a PCR primer for the coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; zinc finger protein 234-72.38; tumour; cytostatic; diabetes; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide-human ATP dependent membrane conjugated zinc proteinase 10.45 and polynucleotide for encoding such polypeptide.
                                                                          Human, ATP dependent membrane conjugated zinc proteinase 10.45; enzyme; development disturbance; lipid metabolism disease; gene therapy; PCR;
ATP dependent membrane conjugated zinc proteinase 10-45 PCR primer #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

nucleic acid target, using a fluorescently labeled probe which produces reduced fluorescence emission when hybridised to the target nucleic acid. The method comprises measuring the reduction in emission caused by hybridisation. The new method is particularly used to quantify target nucleic acids by a real-time polymerase chain reaction, e.g. for quantifying microbial cells in co-cultures or symbiotic systems, for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to determine a Tm value. Methods of the invention allow target nucleic acids to be quantified quickly, easily and accurately. Particularly there is no need to remove unbound probe, and no materials are introduced that inhibit amplification by Taq polymerase (so conventional PCR conditions can be used). The specificity of PCR is kept
                                                                                                          The present invention relates to human zinc finger protein 234-72.38 (see 89859122). The protein can be used for treating diseases such as tumours and diabetes. The present sequence is a PCR primer, which was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining the concentration of a target nucleic acid, useful e.g. for detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.

The invention relates to the determination of the concentration of a nucleic acid target, using a fluorescently labeled probe which produces cauced fluorescence emission when hybridised to the target nucleic acid. The method comprises measuring the reduction in emission caused by hybridisation. The new method is particularly used to quantify target nucleic acids by a real-time polymerase chain reaction, e.g. for quantifying microbial cells in co-cultures or symbiotic systems, for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to be quantified quickly, easily and accurately. Particularly there is no need to remove unbound probe, and no meterials are introduced that inhibit amplification by Taq polymerase (so conventional PCR conditions can be used). The specificity of PCR is kept high (amplification of primer dimers is delayed), and the limit of quantitation is reduced. Complex probes are not needed, and amplification quantitation is reduced. Complex probes are not needed, and amplification can be monitored in real time. The working graph for data analysis (automatically generated by a computer) has a higher correlation coefficient than conventional graphs so more accurate quantitation is possible. The current sequence represents a synthetic deoxyribooligonucleotide that was used for investigating the base ö Determining the concentration of a target nucleic acid, useful e.g. for detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                   ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Measurement of nucleic acids, using a nucleic acid probe and analysis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid
                   (automatically generated by a computer) has a higher correlation coefficient than conventional graphs so more accurate quantitation is possible. The current sequence represents a synthetic deoxyribooligonucleotide that was used for investigating the base selectivity of a target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Probe; polymorphism detection; mutation detection; disease diagnosis; microbial identification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                       The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Yamada K;

                                                                                                                                                        The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleocide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAQ62395-449 are primers which were used in the construction of the vector pVACI. This vector is based on the commercially available vector pRc/RSV. Leader sequences and termination signals were introduced into the vector to allow for production of fusion proteins. The vector, pSfi/Not.Tagl, was modified to replace the pelB leader with the human immunoglobulin VH1 leader sequence that permits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  VH1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modulating immune response to a disease marker \cdot by administering a vector which expresses the disease marker to interact with the immune
Pluorescently-labeled nucleic acid probes for assaying nucleic acids their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and

The method comprising, obtaining a sheep DNA sample, and analysing the sample DNA with a probe to determine the presence or absence of a polymorphism in fibroblast growth factor receptor 3 (FGFR). The invention is used for diagnosing if sheep carry the gene for SLS, used to eliminate carriers of the syndrome from a flock. SLS or hereditary chondrodypalasia is a semi-lethal congenital disorder in sheep causing severe skeletal abnormalities. The present sequence is a 5' PCR-RFLP primer used to detect nucleotide transversion in sheep FGFR3 gene. The FGFR3 gene is located on chromosome 6
encoding of an Sfil cloning site without modification of the amino acid sequence. This fragment was then cloned as an EcoRI/Blunt-HindIII fragment into NotI/Blunt- HindIII cut vector pRc/RSV to give pVACI. The single chain FV for an individual patient can be inserted within the VHI leader sequence. This plasmid when encoding a single chain murine antibody/retroviral envelope fusion protein can be used as a plasmid vaccine and it induces a strong humoral response to the antibody moiety in BALB/c mice. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying a genetic marker for spider lamb syndrome, used to diagnose if sheep carry a gene for the syndrome, involves analyzing sheep DNA samples for mutations in fibroblast growth factor receptor 3.

The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4
                                                                                                                                                                                                                        Solute carrier family 6 neurotransmiter transporter; sectonin 4; SLC6A4; genotyping; allele specific oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 9 gene for identifying drugs for treating disorders related to expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-DEC-2001;
                                                                                                                                                                                                                                                                                                                                                                                                   25-MAR-2004
                       ADO42630;
  The invention relates to amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence comprising providing a cancer-associated DNA sequence comprising providing a providing of template polymucleotide, ligating a loop-forming oligonucleotide to the 3'-end of the sense strand, annealing the loop-forming oligonucleotide to the pathandle structure, comprising the pathandle structure is subjecting the pathandle structure of a first primer homologous to the second portion, where the unknown region is amplified. In the method of comprising the known region that flanks a known region of a sancer-associated DNA sequence, the template polymucleotide comprises a sense strand, comprising the known and unknown regions. The unknown region is comprised a first or second portion. The first portion is nearer the unknown region than is the known region. The known complementary to the second portion. The first portion is nearer the unknown region for second portion is generated at the free end of the comprises ATFI (not defined) or BCR (B cell receptor). The method is useful for amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence. The cancer-associated DNA sequence. Comprises ATFI (not defined) or BCR (B cell receptor). The method is useful for amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence. Also disclosed as new is the use of the method in the analysis of the breakpoint region of the human MLL second on the associated with ALL and AML (acute lymphoblastic comprised acute mayorance is a poster on the pread on chromosome such as a sociated with ALL and AML (acute lymphoblastic comprised acute mayorance is a poster of the manalysis of the preakpoint region of the method is a concer-associated with ALL and AML (acute lymphoblastic concerts). The method is a concert associated with ALL and AML 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Amplifying an unknown region that flanks a known region of a cancerassociated DNA sequence by subjecting the panhandle structure to extension and to PCR in the presence of a first primer homologous to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    11q23. The present sequence is a PCR primer used the method of the invention to isolate the unknown region adjacent to the BCR cancer gene.

The present invention describes a Trypanosoma brucei trypanosome suppressive immunomodulating factor (TSIF) protein. The present invention also describes: (1) the TSIF protein having the primary structural information of amino acids 1-553 of the 833-amino acid sequence of SEQ ID NO:2 (ADP74801) or its fragment or allelic variant having caquence of SEQ ID NO:2 (ADP74801) or its fragment or allelic variant having activity; (2) an isolated polymocleotide comprising a 2826 base pair sequence of SEQ ID NO:1 (ADP74800) which encodes the TSIF polypebtide; (3) a vector comprising the nucleic acid; (4) a genetically engineered host cell comprising the expression vector; and (5) preparing a diagnostic assay for detecting the presence of a Trypanozoon infection in a mammal. TSIF has immunosupressive activity, and can be used in gene therapy. The TSIF polypeptide or polynucleotide can be used in gene
             preventing a NOVX-associated disorder, e.g., cancer, atherosclerosis, diabetes, Alzheimer's disease, Parkinson's disease, graft-versus-host disease, soleroderma, hypertension, haemophilia, idiopathic thrombocytopenic purpura, immunodeficiencies, AIDS, dyslipidemia, obesity, Crohn's disease, bronchial asthma, anorexia, cancer-associated cachexia, multiple sclerosis or fertility. The nucleic acids may be used as hybridisation probes, in chromosome mapping, in tissue typing, in preventive medicine or in pharmacogenomics. This sequence represents a PCR primer used in analysis of expression of a human NOVX polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide derived from Trypanosomes, useful in preparing a medicament for suppressing the immune response in a mammal for treating autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Trypanosoma brucei; trypanosome suppressive immunomodulating factor; TSIF; immunomodulating activity; Trypanozoon infection; immunosuppressive; gene therapy; immune response; autoimmune disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human NOVX polypeptides and nucleic acid molecules, useful for diagnosing, preventing or treating NOVX-associated disorder, e.g. cancer, atherosclerosis, diabetes, Alzheimer's disease, Parkinson's disease or scleroderma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human NOVX polypeptides and the polymucleotides encoding them. The invention also relates to antibodies specific to the NOVX polypeptides. The polypeptides, polymucleotides and antibodies are useful for manufacturing a medicament for treating a syndrome associated with a human disease, such as a pathology associated with the NOVX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Guo XS

                                                                                                                  ô
a medicament for suppressing the immune response in a mammal for treating autoimmune disorders. The present sequence represents a PCR primer for TSIF, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                     Heavy chain; light chain; antibody; chimeric; variable; constant; domain; Fab; rescue; phagemid; PCR; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Two prepns. of PCR-amplified VH genes were made. Both prepns. used an equimolar mixt. of the HUJHFOR primers; in one of the prepns, 6 separate PCR amplifications were performed with each of the HUJHBACK primers individually (1a-6a). The template was CDNA prepd. from RNA obtd. from B lymphocytes, and the prod. was further manipulated to yield the human VH domain. See also AAQ32260-349. (Updated on 25-MAR-2003 to correct PN
                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Prodn. of specific binding pair members - by producing libraries of polypeptide chains displayed by a package, and selection.

The primer was used to amplify the H chain V region from a human monoclonal anti Rh-D cell line Fog-1 (Ig-k). It is one of 6 VH Back monoclonal anti Rh-D cell line Fog-1 (Ig-k). It is one of 6 VH Back monoclonal anti Rh-D cell line Fog-1 (Ig-k). It is one of 6 VH Back to primer RAQ223706-705) used together with the forward primer HulgG1-4 CHIHFOR (AAQ223716) for the H chain fragment, VK-CK, was prepd. Cragment. A corresponding light chain fragment, VK-CK, was prepd. Cragment. The PCR prod. was ligated into the vector, pJM-1-Fab Dl.3 (AAQ23857) and the ligation mixt. used to transform E. coli cells. 96 of the resulting clones were screened for anti-Rh-D activity; 40% crassembly process and the potential of this technique for one step cloning assembly process and the potential of this technique for one step cloning cells, demonstrating a high frequency of successful splicing in the assembly process and the potential of this technique for one step cloning coll human hybridomas. The pri-mers were also used to amplified a VH-CHI resulting clones, VH and vlambda genes of 15 clones were PCR amplified. 3 clifferent H chain and 2 different light chain families were PCR amplified. 3 clifferent H chain and 2 different light chain families were PCR amplified. 3 clifferent H chain and 2 different light chain families were PCR amplified. 3 clifferent Lechnique to assemble, clone and were typical of anti-Rh-D vgenes. The results demonstrate the potential of the technique to assemble, clone and isolated human Ab fragments from the technique to assemble, clone and isolated human Ab fragments from the polyclonal cell populations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                            pTK genes were identified using two sets of degenerative oligonucleotide primers: a first set which amplifies all pTK DNA segments (AAQ49743-44), and a second set which amplifies highly conserved sequences present in the catalytic domain of the c-kit subgroup of pTKs (AAQ49745-46). The pTK genes identified are described in AAQ49747-57 and AAR41897-02. (Updated on 25-MAR-2003 to correct PN field.)

The sequence is that of PCR primer HuVHJaBACK which was used, individually or in an equimolar mix of all 6 HuVHBACK primers (AAQ39333-Q39338), in the prepn. of PCR-amplified VH genes. It was used as part of a method of producing chimeric mouse-human antibodies or fragments which have the same binding specificity as a parent Ab but have increased human characteristics, preventing anti-globulin response in humans. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                   Producing human antibody polypeptide dimer specific for antigen comprises use of chain shuffling using phage expression, useful for reducing anti globulin responses in humans for increased human

The primers (AAQ48987-Q49045) are used in the amplification of Kappa and lambda-chain genes of various antibodies. These genes are then recombined into the same replicon, resulting in very diverse libraries of antibody chains, e.g. from unimmunised donors. It is also useful for chain shuffling, mutagenesis, humanising and CDR imprinting. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A set of degenerate primers (AAT03085-86) designed to amplify all protein tyrosine-kinase (pTK) sequences was used with a second set (AAT03087-88), which amplified highly conserved sequences present in the catalytic domain of the c-kit subgroup of pTKs, in a 2-step PCR to obtain probes used to screen cDNA libraries for the identification of novel pTK genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Agonist antibodies which activate specific protein tyrosine kinase(s) - also activate chimeric proteins of kinase extracellular domain and Ig constant domain, useful for studying, and therapeutic modulation of, ce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAT29175-88 are primers which were used in the method of the invention for the detection of antibody genes which encode antigen specific antibodies. The method comprises activating a lymphocyte with an antigen and synthesizing cDNA from the mRNA contained in the lymphocyte. Heavy and/or light chain coding regions are amplified using primers corresponding to part of the variable region of the immunoglobulin. The cDNA encoding the amplified gene is melted to generate single stranded fragments. The cDNA encoding the antibody of interest is separated from the other cDNA by the difference in single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detection and cloning of an antibody gene - using PCR, dissociating the gene into single strands and isolating the gene from a cDNA mixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

hybridizable polynucleotides) comprising a contiguous nucleotide sequence coding for a human antibody with factor VIII specificity which has hemostatic activity. (I) is useful a primer or probe for detecting the presence of inhibitory antibodies directed against factor VIII. The polypeptides of the invention and the antibodies generated from them are useful in compositions for neutralizing factor VIII inhibiting antibodies in hemophilia A patients. AAC43841-Z4388 represent primers used in the amplification of a human IgG4 heavy chain which is used in the method of
                                                                                                                                                                                                              New polynuclectide, polypeptide and antibody useful for diagnosing the presence of neutralizing antibodies against factor VIII and for treatment of hemophilia A patients with these antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention describes a novel polynucleotide (I) (and complements and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes methods of screening a DNA construct library for a single chain monoclonal antibody fusion reagent capable of binding a transcriptional associated biomolecule in vivo. The antibodies are useful in treating Hepatitis A and B respiratory synctial virus, HIV, Junin virus, Herpes simplex I and II, rubella, cytomegalovirus, Varicella-Zoster virus, Epstein-Barr virus, mesales, hantavirus, dengue, Ebola inter alia and cancer. Expression vectors that encode the fusion antibodies may be used in gene therapy. The methods can be used to create and isolate the fusion antibodies. The monoclonal antibody fusion reagent can be used to regulate transcription in vivo. AAX76591 to AAX76674 human sFv library

Albumin fusion proteins comprising a therapeutic protein and albumin, useful in the treating immune system disorders (e.g. transplant rejection), blood related disorders (e.g. myocardial infarction) and hyperproliferative disorders. Disclosure; Page 538; 606pp; English.

The present invention relates to albumin fusion proteins, which comprise a therapeutic protein and albumin. The albumin fusion proteins are useful in the treatment, prevention, diagnosis, and/or detection of diseases/disorders such as immune system disorders (e.g. transplant rejection), blood related disorders (e.g. myocardial infarction), renal disorders (e.g. childhood acute myeloid leukemia), renal disorders (e.g. childhood acute myeloid leukemia), renal disorders (e.g. childhood acute myeloid leukemia), arrhythmias), respiratory disorders (e.g. non-allergic rhinitis), neurological diseases (e.g. Alzheimer's disease), endocrine disorders (e.g. phocytochroma), reproductive system disorders (e.g. syphilis), infectious diseases (e.g. masseles), asstrointestinal disorders (e.g. infectious diseases (e.g. masseles), asstrointestinal disorders (e.g. infectious diseases) and wound healing. In the present invention, had a second allocate function masseles (e.g. masseles), assured to generate function masseles. proteins. The present sequence was used to illustrate the invention

```
The invention relates to human albumin (HA) fusion proteins and their corresponding nucleic acid sequences. Therapeutic proteins fused to albumin or its fragments have an extended shelf-life. The albumin fusion proteins are useful in the treatment, prevention, diagnosis, and/or proteins are useful in the treatment, prevention, diagnosis, and/or detection of diseases, disorders buth as immune system disorders (e.g. transplant rejection), blood related disorders (e.g. childhood acute myeloid infarction), hyperproliferative disorders (e.g. childhood acute myeloid cleukaemia, metastatic renal cell carcinoma), renal disorders (e.g. malignant melanoma, renal cell carcinoma), renal disorders (e.g. arrhythmias), respiratory disorders (e.g. non-allergic rhinitis), neurological diseases (e.g. Alzheimer's disease), endocrine disorders (e.g. pheocytochroma), reproductive system disorders (e.g. syphilis), infectious diseases (e.g. reproductive system disorders (e.g. syphilis), infectious diseases (e.g. measles), gastrointestinal disorders (e.g. irritable bowel syndrome), HIV (human immunodeficiency virus) infection and wound healing. Nucleic acids encoding albumin fusion protein is used in gene therapy. The present sequence is a PCR primer used to amplify human heavy chain variable consult (VH) gene. Note: The present sequence is incorrectly reffered as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                      Albumin fusion proteins comprising a therapeutic protein and albumin,

The invention relates to human G-protein chemokine receptor (CCR5)

CC HOGNR10 polypeptides and polynucleotides. CCR5 HOGNR10 antibodies are

CC useful for treating, preventing or ameliorating a disease or disorder

associated with inflammation, defective or aberrant chemotaxis of immune

CC astroam) or defective or aberrant T-cell antigen presenting cell

interaction. The disease or a powritus infection, a

cytomegalovirus infection such as an early stage HIV infection, a

cytomegalovirus infection, or a powritus infection, a

CC disease (e.g. rheumatoid arthritis) or a neurodegenerative disease

CC disease or disorder may be associated with aberrant CCR5 expression, lack

disease or disorder may be associated with aberrant CCR5 expression, lack

cof CCR5 function, aberrant CCR5 ligand expression, or lack of CCR5 ligand

cof CCR5 function, aberrant CCR5 ligand expression, or lack of CCR5 ligand

cof CCR5 function, and protein is used as a food additive or preservative

cof increase or decrease storage capabilities. CCR5 HOGNR10 DNA are useful

cof increase or decrease storage capabilities. CCR5 HOGNR10 DNA,

cof core, tromosome identification and in gene therapy. CCR5 HOGNR10 DNA,

corporated, bone marrow, gastrointestinal tract, liver, lung,

curogenital); immune disorders (Addison's disease, allergies, autoimmune

curogenital); immune disorders (Addison's disease, allergies, autoimmune thyocaditis, diabetes mellitus, Crohn's

disease, multiple solerosis, rheumatoid arthritis and ulcerative colitis)

credions of WH domain appedifically binds to the G-protein chemokine

credions of WH domain appedifically binds to the G-protein chemokine ö Isolated nucleic acid encoding a human G-protein chemokine receptor (CCRS) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and neurodegenerative disorders. where the iraginant of variant has allowin for therapeutic processive,
antidiabetic, antirheumatic, antiarthritic and psoriatic activities.
Abbumin proteins are stabilised therapeutic proteins e.g.
antidiabetic, antirheumatic, antiarthritic and psoriatic activities.
Abbumin fusion proteins are stabilised therapeutic proteins e.g.
antibodies to C5, C242 and CD80 useful for treating various diseases and
disorders such as non-Hodgkin's lymphoma, cancer, obesity, transplant
of fisher and proteins are allitus, rheumatoid arthritis and psoriasis.
Fusing albumin to therapeutic proteins the in vitro or in vivo
protein, extends the shelf life and retains the in vitro or in vivo
protein, extends the shelf life and retains the protein
solutions with large excesses of carrier proteins to prevent loss of
therapeutic proteins due to factors such as binding to the container. The
fusion proteins are easily dispensed with a simple formulation requiring
minimal post storage manipulation. The fusion of therapeutic proteins to
albumin confers stability in aqueous or other solution. The present
sequence represents a PCR primer which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an albumin fusion protein (I) comprising a therapeutic protein: X and (a fragment or variant of) albumin comprising a the fully defined sequence in ABB79006 of 585 amino acids, (where the fragment or variant has albumin or therapeutic protein: X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New albumin fusion proteins, useful for treating diseases and disorders such as cancer, comprise therapeutic protein fused to albumin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; G-protein chemokine receptor; CCRS; HDGNR10; inflammation; infimute cell chemotaxis; autoimmune disease; rheumatoid arthritis; neurodegeneration; viral infection; Raposi sarcoma; cancer; hyperproliferative disease; neurological disease; PCR; primer; VH domain;
                                                                                                                                                                                                                                                                                                                        The invention provides a composition comprising one or more antisense oligonucleotides directed against vascular endothelial growth factor (VEGF) Where the antisense oligonucleotides inhibits profileration of between 0.5-2.5 micro Ma. The antisense oligonucleotides may be directed against VEGF for inhibiting cancer cell proliferation and angiogenesis. Preferably the oligonucleotide AAAL3031 (a modified version of AAAL2984) is used and may be utilized to treat Kaposi's sarcoma, ovarian cancer, prostrate cancer, pancreatic cancer or melanoma. metalloprotease (MP-1). (I) is useful for preventing, treating, or metalloprotease (MP-1). (I) is useful for preventing, treating, or ameliorating a medical condition, particularly an immune disorder, an aberrant glutamate transport or motor neuron disorder, such as amyotrophic lateral sclerosis (ALS), its juvenile form or an ALS-like condition. The compositions and methods are also useful for diagnosing, prognosticating, treating, ameliorating and/or treating disorders associated with MP-1 activity, e.g. diabetes, cancer, reproductive disorders (e.g. Klainfelter's syndrome, genital warts, or germinal cell aplasia), metabolic disorders (e.g. premature puberty, Kallman syndrome, or Cushing's syndrome, neurodegenerative diseases (Alzheimer's disease, Huntington's disease or Tourette syndrome), liver and renal diseases and immune disorders (e.g. AIDS, rheumatoid arthritis or sepsis), pulmonary diseases (e.g. pneumonia, emphysema or cystic fibrosis) and vascular, inflammatory and neurological disorders (e.g. Alzheimer's disease or Parkinson's disease). This sequence represents a primer associated with the novel human metalloprotease MPI polynucleotide
                                                                                                                                                                                                                                                                                                              New isolated nucleic acid encoding MP-1 protein, useful for preventing, treating, or ameliorating diseases associated with aberrant metalloproteinase activity, e.g. immune, metabolic, inflammatory and neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an isolated nucleic acid molecule (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Capture agent; nested sorting; gene library; PCR primer; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 17.2; DB 1; Length 23; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the isolation of a novel human G-protein chemokine receptor (CCRS) designated HDGNR10, and polynucleotide sequences encoding it. The invention also describes antibodies that bind human G-protein chemokine receptor (CCRS) HDGNR10 and polynucleotide that bind human G-protein chemokine receptor (CCRS) HDGNR10 and polynucleotide sequences encoding the antibodies. The antibodies are useful for treating or preventing inflammation, defective or aberrant chemotaxis of immune cells and T-cell/antignen-presenting cell interactions, infections and autoimmune diseases, rheumatoid arthritis, neurodegeneration, viral infections (especially early-stage human immune deficiency virus (HIV), cytomegallovitus or pox virus infections, Kaposi sarcomm, or conditions associated with aberrant or deficient expression of the CCRS receptor or its ligands. The antibodies are also useful to determine CCRS expression, ce.g. for diagnosis, prognosis and monitoring of cancer and other hyperproliferative diseases. The polynucleotide sequences encoding human G-protein chemokine receptor (CCRS) HDGNR10 can be used to produce the recombinant receptor, and in the treatment of a wide range of diseases (e.g. parkinson's disease), and hyperproliferative diseases (e.g. cancer). ABKS1871-ABKS1906 represent PCR primers used to amplify VH and VL domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Metalloprotease; MP-1; immune disorder; glutamate transport; cancer; motor neuron disorder; amyotrophic lateral sclerosis; ALS; diabetes; reproductive disorder; Kleinfelter's syndrome; germinal cell aplasia; genital wart; metabolic disorder; premature puberty; Kallman syndrome; Cushing's syndrome; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; Huntington's disease; Tourette syndrome; sepsis; liver disease; renal disease; immune disorder; rheumatoid arthritis; acquired immunodeficiency syndrome; AIDS; pulmonary disease; pneumonia; emphysema; cystic fibrosis; vascular disorder; inflammatory disorder; neurological disorder; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                New nucleic acid encoding an antibody specific for the G-protein chemokine receptor CCR5, useful for treatment and diagnosis of e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.5%; Score 17.2; DB 1; Length 23; 86.4%; Pred. The invention relates to a combination comprising capture agents which specifically bind to a polypeptide and, oligonuclectides that comprise a sequence that encodes a preselected polypeptide to which the agents bind. The anti-tag capture agents such as antibodies are used as tools for sorting proteins containing polypeptide tags for which the capture agents are specific and for a process of nested sorting. The agents are useful for functional surveys of large diversity libraries such as gene libraries. The present sequence is a PCR primer used to amplify human antibody heavy chain variable region (VH) gene. This primer is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel human potassium channel beta-subunit, K+betaM3 polypeptide and polynucleotide for diagnosing, preventing and treating immune, metabolic, gastrointestinal, renal, neural and proliferative diseases or disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; potassium channel beta subunit; K+betaM3; cytostatic; anti-HIV; antiaddictive; antiarthritic; antiasthmatic; antirheumatic; antianaemic; antibacterial; immunosuppressive; antipsoriatic; dermatological; nootropic; neuroprotective; anticonvulsant; neuroleptic; antimanic; antidepressant; antiulcer; antiinflammatory; antidiartheic; antipyretic; antianphotropic; hypotensive; antianpinal; uropathnic; tocolytic; unlnerary; antiallergic; gene therapy; neural disorder; immune disorder; cancer; proliferative disorder; antibody; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes the human potassium channel beta-subunit
                                                              Combination of capture agents used as tools for sorting proteins containing polypeptide tags for which the capture agents are specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

antiasthmatic, anti-HIV, antirheumatic, antibacterial, immunosuppressive, antipacratic, dermatological, antianematic, antibacterial, immunosuppressive, antipacratic, dermatological, antianematic, neotropic, neuroprotective, antioninament, neuroprotective, antidiarematic, antidepressant, antidiarematory, antidiarematic, nephrotropic, hypotensive, antianginal, uropathic, tocolytic, antiallergic and vulnerary activities, and can be used in gene therapy. (I) can be used for diagnosing a pathological condition (or susceptibility) in a subject, and for related to aberrant neurotransmitter release or drug addiction, a disorder related to aberrant neurotransmitter release or drug addiction, a disorder related to hyper pocassium channel activity, an immune disorder related to hyper pocassium channel activity, an immune disorder related to tansplant rejection, immune disorder in which immunosuppression is desirable, a proliferative disorder related to aberrant cell cycle checkpoint, or aberrant cell cycle checkpoint, or aberrant cell cycle checkpoint, or aberrant on a proliferative disorder related to an aberration(s) in the call cycle checkpoint, or aberrant DNA damage repair. (I) can also be used for disordering, treating, prognosing, and/or preventing immune for an antiphody against K+betaM3, which is used in an example

The present invention describes a human G protein coupled receptor (GPCR), designated HGPRBMY27 (I). (I) has antiinflammatory, antiinferlilty, pulmonary, cytostatic, nephrotropic, hormonal and circulatory activities, and can be used in gene therapy. (I) or the protein encoded by it can be used to prevent, treat, or ameliorate a medical condition, such as inflammatory disorders, reproductive disorders, pulmonary disorders, cancer, renal disorders, connective tissue disorders, endocrine disorders, or disorders involving aberrations in tubular tissues. They can also be used to diagnose a pathological condition or a susceptibility to (I). The protein can be used to screen for candidate compounds capable of modulating activity of a GPCR polypeptide. The present sequence represents a PCR primer for the VH domain of an antibody against human HGPRBWY27, which is used in an antibody against human HGPRBWY27, which is used in an
                                                                                                                                                                   New polynucleotide encoding a human G-protein coupled receptor for preventing, treating, or ameliorating e.g. an inflammatory, reproductive, pulmonary, renal connective tissue, or endocrine disorder.
                                                                                                                                                                                                                                                                                                                                                                         Example 34; Page 298; 356pp; English.

AAD42429; RUBE/) RESULT 679 AAD42429 ઠ ö The invention relates to an isolated polynucleotide encoding a potassium channel beta subunit (K+betaM6) polypeptide or its variants. The human potassium beta subunit polynucleotide or polypeptide is useful for diagnosing, preventing, treating or ameliorating a pathological condition such as gastrointestinal, reproductive, neural, sleep, cardiovascular or pulmonary disorders, a disorder related to hyperpotessium channel activity, an immune disorder related to berrant NE activity, pineal gland associated disorders migraine headaches, disorders associated with aberrant melatonin synthesis and/or release or with low DNA repair capacities or low free-radical buffering capacity, delayed sleep phase syndrome, aberrations in circadian cycle, mammary cancer tumourigenesis, age related disorders associated with decreased melatonin secretion, or cancer. This polynucleotide sequence represents a PCR primer relating to the potassium channel beta subunit (K+betaM6) of the invention polypeptide, useful for diagnosing, preventing, treating or ameliorating Gaps Albumin fusion protein; therapeutic protein X; human albumin; HA; human serum albumin; HSA; cancer; reproductive disorder; disorder; disorder; disorder; immune disorder; endocrine disorder; haematopoietic disorder; natial disorder; connective disorder; cytostatic; antiinfertility; antiinflammatory; antiulcer; immunomodulator; anti-HIV; antiinflammatory; antiulcer; neuroprotective; antiparkinsonian; antimicrobial; neuroleptic; osteopathic; antiarthritic; VH domain; PCR; primer; ss. .; 0 Ouery Match 0.5%; Score 17.2; DB 1; Length 23; Best Local Similarity 86.4%; Pred. ```
The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's limmunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheimer's, parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoprosis, arthritis). ABK93295-ABK93304 represent PCR primers used to amplify DNA encoding human antibody VH domains in the examples of the present invention

defective or aberrant chemotaxis of immune cells or T cell antigen-
presenting cell interaction, viral infections (specifically human immune
deficiency (including its early stages), cytomegalo or pox viruses),
autoimmune disease, rheumatoid arthritis, neurodegeneration, Pneumocystis
carinii infection, Kaposi's sarcoma or any condition associated with
aberrant expression of CCR5 or their ligands. They are also used for the
detection, diagnosis, prognosis and monitoring of cancers or other
hyperproliferative diseases. The present sequence is a PCR primer used to
amplify human HDGNR10 antibody heavy chain variable (VH) domain

New potassium channel beta-subunit, K+betaM2, proteins and nucleic acids, useful for diagnosing, treating and/or preventing e.g. reproductive, neural, metabolic, endocrine, memory, neurodegenerative disorders or

Example 19; Page 358; 366pp; English.

diseases.

The present invention relates to human potassium channel beta-subunit (K+betaM2) proteins and polynucleotides encoding such proteins. The K+betaM2 sequences are useful for diagnosing, treating and/or preventing reproductive disorders, neural disorders, disorders related to aberrant potassium regulation or hyper potassium channel activity, metabolic

growth hormone synthesis and/or secretion), memory disorders, disorders of the testis (e.g. spermatogenesis), neuroendocrine condition related to aberrant thyroid hormone release, renal disease or disorders (e.g. aberrant thyroid hormone release, renal disease or disorders (e.g. chephritis), disorders related to aberrant higher brain function (e.g. disease), proliferative disorders (e.g. carcinoid tumour) and disorders (c.g. involving excessive smooth muscle tone or excitability (e.g. asthma).

They may be used to modulate haemostatic or thrombolytic activity, to treat or prevent blood coagulation diseases or disorders, blood platelet diseases, wounds, autoimmune diseases or disorders, blood platelet or rheumatoid arthritis), allergic reactions (e.g. asthma), organ rejection or graft-versus-host disease, and hyperproliferative diseases. K+betema cor graft-versus-host disease, and hyperproliferative diseases. K+betema cor graft-which is used for amplifying the VH domain of antibodies of directed against human K+betaM2 DNA. This sequence is used in the

New isolated nucleic acid molecules encoding human glycine receptor A4 (HGRA4) polypeptides, useful for preventing, treating and ameliorating conditions, e.g. neural or gastrointestinal disorders.

Example 24; Page 341; 349pp; English.

The present invention provides the protein and coding sequences of the human glycine receptor alpha 4 (HGRA4) and its splice variant HGRA4sv. The sequences can be used in the treatment of neural disorders, gastrointestinal disorders, disorders related to hyper glycine receptor

The antibodies are useful for preparing a composition for the treatment of cancer, and for imaging tumours associated with activated stromal fibroblasts, such as colorectal cancer, non-small-cell lung cancer, breast cancer, head and neck cancer, ovarian cancer, lung cancer, bladder cancer, approxeatic cancer and metastatic brain cancer, and diseases associated with the same, such as inflammation and wound healing. The present sequence is a PCR primer described in the exemplification of the
activity, cardiovascular disorders, reproductive disorders, or bacterial, viral and parasitic infections. The present sequence is a PCR primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human humanized antibody that specifically binds to fibroblasts activating protein alpha, useful for treating cancer or tumor, and for imaging tumors associated with activated stromal fibroblasts, e.g. lung or breast cancer.

The present invention relates to a human or humanised antibody (Ab) which specifically binds to fibroblast activating protein alpha (FAPalpha). The antibodies are useful for preparing a composition for the treatment of cancer, and for imaging tumours associated with activated stronal fibroblasts, such as colorectal cancer, non-small-cell lung cancer, breast cancer, head and neck cancer, ovarian cancer, lung cancer, bladder cancer, pancreatic cancer and metastatic brain cancer, and diseases associated with the same, such as inflammation and wound healing. The present sequence is a PCR primer described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human humanized antibody that specifically binds to fibroblasts activating protein alpha, useful for treating cancer or tumor, and for imaging tumors associated with activated stromal fibroblasts, e.g. lung or breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

```
New isolated K+betaM4 or K+betaM5 nucleic acid molecule, useful for preventing, treating or ameliorating a medical condition related to hyper potassium channel activity such as cancer, immune, neural and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neuroprotective; antiinflammatory; immunosuppressive; cytostatic; neural; nephrotropic; cardiant; human G-protein receptor; HGRBMY28; HGRBMY29;
                              hyper potassium channel activity; hepatic disorder; neural disorder; gastrointestinal disorder; reproductive disorder; immune disorder; cardiovascular disorder; renal disorder; immune disorder; apoptosis; infectious disease; inflammatory disorder; cancer; Hepatotropic; Cerebroprotective; Neuroprotective; Gastrointestinal; Gymecologica; Immunomodulator; Cardiovascular; Immunostimulant; Immunosuppressive; Nephrotropic; Antinflammatory; Cytostatic; Gene Therapy; human; VH; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               K+betaM4 and K+betaM5, CDNA sequences (I, ADJ33294 and ADJ33316), and encoded proteins sequences (II, ADJ33295 and ADJ33317). The invention is useful for preventing, treating or ameliorating a medical condition by administering (I) or (II) to a mammalian subject, where the medical condition is a disorder related to hyper potassium channel activity selected from a hepatic, neural, gastrointestinal, reproductive, immune, cardiovascular or renal disorder, or an immune disorder related to aberrant apoptosis or innate immunity, an infectious disease, an inflammatory disorder and cancer. The present sequence is a primer used in an example from the invention for amplifying VH domains, for the ktbetaM5 proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to human potassium channel beta subunits,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Siemers N;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ch 0.5%; Score 17.2; DB 1; Length 23; I Similarity 86.4%; Pred. No. 1.1e+03; 19; Conservative 0; Mismatches 3; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human GPCR related VH antibody cloning primer SEQ ID 142.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lee L, Chen J, Jackson DG, Ramanathan C, Carroll P;

This invention relates to an isolated nucleic acid molecule comprising a polynucleotide encoding a human G-protein receptor, including HGRBMY28, CC HGRBMY29, HGRBMY29, DO HGRBMY29, ZO PyPeptides. The HGRBMY28 or HGRBMY29 polypeptides and nucleic acids are useful for treating, preventing or ameliorating a medical condition, e.g. an immune disorder, an inflammatory disorder, an inflammatory disorder, an inflammatory disorder, an inflammatory disorder, a parameter, a gastrointestinal disorder, a neural disorder, a pulmonary cisorder, a gastrointestinal disorder, a disorder related to aberrant p27 regulation, a disorder related to aberrant p27 regulation, a disorder related to aberrant DNA repair regulation, a disorder related to aberrant DNA repair regulation, a disorder related to aberrant capoptosis regulation, a disorder of the spleen, a disorder of the lymph capoptosis regulation, a disorder of the spleen, a disorder of the lymph capoptosis regulation, a disorder of the spleen, a disorder of the lymph capoptosis regulation, a disorder of the spleen, a disorder of the lymph capoptosis regulation, a disorder of the spleen, a disorder of the lymph capoptosis regulation, a disorder of the spleen, a disorder of the lymph capoptosis regulation, a disorder of the spleen, a disorder, a renal disorder, a cardiovascular disorder, a proliferative disorder, and a disorder of the spleen, a disorder of the colon, cervix, lung, squamous cells or tissues, a renal disorder, a cardiovascular disorder, a placental disorder, and a disorder of the isolated polymucleotides of the invention may be used to treat disorders by gene therapy. This

Novel antibody against TNF-related apoptosis inducing ligand, useful for preventing, treating and ameliorating cancers and other hyperproliferative disorders, binds immunospecifically to TRAIL receptor polypeptide

Example 5; Page 325; 405pp; English.

The Invention Figures to antibodies of the invention are useful for treating treceptors (TRAIL)

receptors (TRAIL-R). Antibodies of the invention are useful for treating, preventing or ameliorating cancer (e.g. cancers of pancreas, uterine, breast, colon, lung and gastrointestine and Kaposi's sarcoma) and other hyperproliferative disorders, neurodegenerative disorders (e.g. brakinson's disease, Alzheimer's disease and Huntington's disease), autoimmune disorders (e.g. thups, rheumatoid arthritis, multiple sclerosis, myasthenia gravis, Hashimoto's disease and immunodeficiency syndrome), inflammatory disorders (e.g. asthma, allergic disorders and rheumatoid arthritis), infectious diseases (e.g. acquired immune deficiency syndrome; AlbS, herpes viral infections and other viral infections), myelodysplastic Syndromes (e.g. aplastic anaemia), graftversus-host disease, ischaemic injury, liver injury, toxin-induced liver disease, septic shock, cachesia, anorexia and proliferative disorders.

Antibodies of the invention are also useful for treating cardiovascular disorders, cerebrovascular disorders, thrombotic microangiopathies, and ulcerative collitis and for wound healing. The invention is also used to prepare vaccines. The primer is used to amplify human antibody VH domain. This primer is used in the exemplification of The invention relates to antibodies that immunospecifically bind to the invention

New isolated polynucleotide encoding an antibody which inhibits vascular endothelial growth factor (VEGF)-2 polypeptide, useful for diagnosing or treating diseases associated with aberrant VEGF-2 expression or function, e.g. cancer.

Example 32; Page 236; 344pp; English.

This invention describes a novel isolated polynuclectide encoding a first antibody comprising an amino acid sequence selected from at least one, two or three complementarity determining (CDR) region(s) of a VH and/or UL domain of a second antibody that immunospecifically binds to a vacular endothelial growth factor (VEGF)-2 polypeptide. The products of the invention have cytostatic, cardiovascular, antibheumatic, vulnerary, antibatinamatory, antiarthritic, antidiabetic, ophthalmological, cardiant, antiallergic, immunosuppressive, dermatological and antipositatic activity. The polynuclectide is useful in diagnosing, treating, preventing, prognosing, ameliotating or monitoring diseases associated with aberrant VEGF-2 or VEGF-2 receptor expression or lack of VEGF-2 or VEGF-2 receptor function, such as cancer and other proliferative disorders (e.g. cerebral anoxia), inflammatory diseases, or reference disorders (e.g. cerebral anoxia), inflammatory diseases, infectious diseases, autoimmune diseases (e.g. rheumatoid arthritis, systemic Lupus Erythematosus, allergies), diabetic retinopathy or soriasis. The polynucleotide, polypeptide and antibodies described in the invention may also be used to stimulate angiogenesis, wound healing, and promoting vascular tissue repair. The polynucleotide and polypeptide may also be used for in vitro purposes related to scientific research, and thousantism of the invention of the contraction of the contract diagnostics and therapeutics e.g. gene therapy and in vaccines to treat human diseases. This sequence represents a PCR primer used in the isolation and amplification of polynucleotides described in the disclosure of the invention

The invention relates to an isolated antibody comprising a first amino acid sequence having 95 % identity to a second amino acid sequence of either variable heavy chain or light chain-complementarity determining regions (VHCDR1)/VLCDR2 or VHCDR3/VLCDR3 appearing as ABG71906-ABG71911 being specific for human TRAIL receptors 1-4 (TNF (tumour necrosis factor) related apoptosis-inducing ligand receptor, also known as TR4, TR5, TR7 and TR10). Also included are an isolated cell that produces the antibody, an antibody that binds the same epitope on a TR4 polypeptide as the antibody that binds the same epitope on a TR4 polypeptide or detecting, diagnosing, prognosing or monitoring cancers, and other hyperproliferative disorders) using the antibodies, a hybridoma cell line selected from the hybridoma cell lines selected from the hybridoma cell lines selected from the hybridoma cell lines solataled in the antibodies expressed by these hybridoma cell lines. The antibodies of the invention are useful for diagnosing or treating a disease or disorder associated with increased or

WPI; 2003-156689/15.

New isolated nucleic acid molecule for diagnosing, treating or preventing disorders, e.g. neuro- and musculo-degenerative conditions or cancer, related to the CAN-12 or CAN-12v2 polypeptides.

Example 35; Page 454; 737pp; English.

The invention relates to an isolated nucleic acid molecule comprising a polynucleotide having a sequence that is at least 95% identical to the human cDNAs for CAN-12 or its variants (CAN-12v1 and CAN12v2), including various functional fragments defined in the specification. CAN-12 is a calpain family cysteine procease, the gene for which is located on chromosome 2p16-p21. Also included are the encoded CAN-12 proteins (including fragments), CAN-12 recombinant vectors, host cells, anti-CAN-

```
a molecule or a molecule complex which comprises the structural coordinates of CAN-12 and CAN-12 would be specification, a method for identifying a mutant with altered biological properties, tentofic function or activity of CAN-12 and CAN-12v2 models given in the specification, a method for identifying a mutant with altered biological properties, function or activity of CAN-12 and CAN-12v2 and a method for designing or selecting compounds as potential modulators of CAN-12 and CAN-12v2. The nucleic acid molecule and the polypeptide are useful in diagnosing, treating and/or preventing various diseases and disorders related to the CAN-12 or CAN-12v2 polypeptides, particularly neuro- and musculocid degenerative conditions, such as cancer, multiple sclerosis, blood disorders, autoimmune disorders, osesphagitis or other osesphagal motility disorders. Many other diseases and disorders are listed in the specification. The methods may be used in identifying agonists and antagonists of the above polypeptide and polynucleotide. The present sequence is a PCR primer used to clone DNAs encoding the VH and VL (heavy and light chain variable regions) molecules of anti_CAN-12 antibodies

New human potassium channel beta subunit (K+betaM8) polypeptide or polynucleotide, useful for preventing, treating or ameliorating e.g. breast or colon cancer, arthritis, asthma, multiple sclerosis, ostecarthritis or ischemia.

Example 32; Page 284; 308pp; English.

The present sequence is PCR primer Hu VH3-5', which is designed to amplify human antibody heavy chain variable regions (VH). It is one of a set of primers (see ACC48651-86) used in the identification and cloning of VH and VL domains of antibodies directed against the novel human

potassium channel beta subunit, K+betaNB (see ABR41902). The VH and VL domains can be used to generate expression vectors. Antibodies directed to K+betaNB are useful for affinity purification of the polypeptide, in diagnostic assays and imaging, in immunophenotyping, and in therapeutic applications, including the use of nucleic acids encoding the antibodies in antibody-based gene therapy. Disorders that may be treated include a male reproductive disorder, a testicular disorder, a disorder related to aberrant calcium, potassium or potassium channel regulation, a pullmonary disorder, an immune system disorder associated with mis-regulation of NPKB, an inflammatory calcium, disorder, an innate immunity disorder, a disorder associated with a failure to initiate and/or sustain an adequate inflammatory response, in the static and a static and a static and a subject of the sustain an adequate inflammatory response, an innate immunity disorder, a disorder associated with a failure to initiate and/or sustain an adequate inflammatory response, an innate inman and a subject associated with a failure to initiate and/or sustain an adequate inflammatory response, and a such a subject associated with a subject associated with a failure to initiate and/or sustain an adequate inflammatory response, and a such a subject associated with a su
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cell mediated autoimmune disease, or psoriasis

(HUMA-) HUMAN GENOME SCI INC.

```
The present invention relates to novel antibodies that immunospecifically bind to TRAIL receptor (TR4). Sequences of the invention are useful for treating, preventing or ameliorating cancer (e.g. colon, breast, uterine, pancreatic, lung, gastrointestinal or central nervous system cancer e.g. medulloblastoma, neuroblastoma, glioblastoma and Kaposi's sarcoma) in medulloblastoma, neuroblastoma, glioblastoma and Kaposi's sarcoma) in detecting, diagnosing, preventing or ameliorating cancers and other hypercreating, preventing or ameliorating neurodegencative disorders (e.g. proliferating preventing or ameliorating neurodegencative disorders (e.g. Alzheimer's disease, multiple amyotrophic lateral sclerosis, retinitis pigmentosa, cerebellar degeneration and Huntington's disease), retinitis pigmentosa, cerebellar degeneration and Huntington's disease), immune disorders (e.g. lupus, rheumatoid arthritis, multiple sclerosis, slogren's syndrome, biliary cirrhosis, disease, Crohn's disease, polymyositis, immune-related glomentlonephritis, mysathenia gravis, discasses (e.g. acquired immunodeficiency syndrome, infections and other viral infections) and proliferative disorders viral infections and other viral infections and other viral infections and thining myelodysplastic scheme of moreatial infarction and reperfusion injury), septic shock, cachexia, and contining callowands and proliferation and toxin-induced liver diseases (e.g. astromasis), ischemic injury (such as that caused by stroke, anorexia and toxin-induced liver diseases (e.g. acheanic) injury), septic shock, cacheanic anorexia and toxin-induced liver diseases (e.g. acheanic) injury diseases such as limb ischaemic an errery diseases such as limb ischaemic an errery diseases such as limb ischaemic and properfusion and reperfusion injury), applied as alcohol). They are also useful for treating cardiovasis and reconstant and experience and provinced and provinced and anorexial inferience and such as alimb ischaemic and provinced and provinced and anorexial and toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          artery diseases such as limb ischaemia, arrhythmia including peripheral failure and cardiovascular tuberculosis, diseases or disorders associated with neovascularisation and coular disorders, for wound healing, for promoting angiogenesis and as adjuvants to enhance immune responsiveness to specific antigen e.g. viral antigen. They are also useful in the preparation or recovery from surgery, trauma, radiation therapy and transplantation. The present sequence is human TR4 antibody VH domain amplifying PCR primer. This sequence is used in the exemplification of the invention
                                                                                                                     Novel antibody useful for treating cancers and other hyperproliferative disorders, immunospecifically binds to TRAIL receptor and comprises variable heavy or light chain complementarity determining regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a nucleic acid molecule, or its complement, that encodes an anti-platelet binding protein, isolated from a phage display clibrary by an in vitro selection process that comprises screening a diverse human antibody variable domain expression library against at least one human platelet antigen, and the human antibody variable domain expression library expresses single-chain proteins. Also included are an expression vector comprising the nucleic acid operably lined to a promoter, a host cell comprising the nucleic acid operably lined to a promoter, a host cell comprising the nucleic acid operably lined to a promoter, a host cell comprising the nucleic acid operably lined to a comprising protein encoded by the nucleic acid that binds to activated or non-activated human platelet glycoprotein IIb/IIIa receptor (and inhibites platelet adaption or thrombus formation), a substantially isolated and purified human antibody (or its fragment) that binds to a platelet binding protein, and a conjugate comprising a non-antigenic polymer covalently linked to the single-chain antigen-binding polymer covalently linked to the single-chain antigen-binding protein, and a conjugate comprising and polypeptide (i.e. the anti-platelet binding protein). The host cell and the anti-platelet binding protein is protein as useful for inhibiting platelet platelet binding protein for wholes blood. The vector is useful for inhibiting platelet to platelet mediated thrombus formation in a blood vessel, the blood vessel having an endothelial lining in need of treatment. The vector, the host cell, the anti-platelet binding protein or the vector is useful for preventing or traating conditions such as venous transluminal corronary angioplasty, atrial fibrilaria, vector, the host cell, the anti-platelet binding protein or platelet mediated formation of glosase, peripheral vascular disease, secondary prevention of arterial thromboembolism, unstable angina, acceptance of secular disease, peripheral intravascular disease, periphera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      programment of the control of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acid molecule encoding anti-platelet binding protein which is useful for inhibiting platelet aggregation or platelet mediated thrombus formation in blood and for treating venous thromboembolism.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated antibody or its fragments such as VHCDR1 (heavy chain variable domain complementarity determining region), VHCDR2, VHCDR3, VLCDR1 (light chain variable domain complementarity determining region), VLCDR2 or VLCDR3. The antibody or its fragment immunospecifically binds TRAIL (tunour necrosis factor; TNF-related apoptosis-inducing ligand) receptor 7 (TR7). TR7 is also referred to as TRAIL receptor 2 (TRAIL: RE), death receptor 5 (DR5) and KILLER. The antibody or its fragment is useful for treating, preventing or ameliorating a cancer, e.g. colon, breast, uterine, pancreatic, lung or gastrointestinal cancer or Kaposi's sarcoma or cancer of the central nervous system such as medulloblastoma, neuroblastoma or graft versus host disease, ALDS (acquired immune deficiency syndrome) or a neurodegenerative disorder. The invention is useful in antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antibody or its fragment, useful for treating, preventing or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                therapy. The present sequence is human VH domain amplifying PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ameliorating a cancer, e.g. colon, breast, uterine, pancreatic, lu
gastrointestinal cancer, or Kaposi's sarcoma or, graft versus host

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes an isolated nucleic acid molecule comprising a sequence that is at least 95% identical to a polynuclectide encoding novel human G-protein coupled receptor HGPRBMYS. The nucleic acid molecule, polypeptide and antibody are useful in diagnosing, preventing, treating or ameliorating medical conditions where GPCR is directly or indirectly involved, such as immune or inflammatory diseases (e.g. arthritis, asthma, AIDS, graft-versus-host disease, psoriasis or systemic lupus erythematosus), reproductive disorders (e.g. varicocele or corditis), neural disorders (e.g. Alzheimer's disease, Parkinson's disease, depression or schizophrenia), cardiovascular disorders (e.g. hypertension or schizophrenia), cardiovascular disorders (e.g. bypertension) acute heart failure), pulmonary disorders (e.g. bypertension) acute heart failure), pulmonary disorders (e.g. obseity, diabertes or annocexia), bone disorders (e.g. carcomosome identification, in identifying organisms from minute chological samples, or as molecular weight markers. This sequence represents a primer used to isolate DNA encoding human variable heavy (VH) chain domains of anti-HGPRBMY25-antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid molecule encoding a human G-protein coupled receptor (HGPRBMY25) is useful for diagnosing, preventing or treating diseases involving the receptor, e.g. inflammation, diabetes, asthma, hypertension

The invention relates to an isolated nucleic acid molecule encoding a G protein-coupled receptor HGPRBMY26. The nuclectide sequence comprises sequential nuclectide deletions from either the C-terminus or the N-terminus. Also included are a isolated polypeptide encoded by the nucleic acid, a recombinant vector comprising the nucleic acid, making a crecombinant host cell comprising the nucleic acid, making a pathological condition or a susceptibility to a pathological condition in testicular tissue of a subject, identifying a compound that modulates the biological activity of a human G-protein coupled receptor HGPRBMY26 (and a member consisting of NPAT/GRE or NPAT alpha 15, all undefined), and careening for candidate compounds capable of modulating activity of the HGPRBMY26 polypetide. The HGPRBMY26 polypetides, polypeutides, polypuncleotides, compounds or pharmaceutical preparations comprising HGPRBMY26 are useful for preventing, treating or ameliorating a male reproductive condition; can amine disorder or a condition, a testicular cancer, choriocarcinoma, nonseminoma, seminoma,
                                                                                                                                        male reproductive condition; amine disorder; testicular disorder; male resticular acancer; choricoarcinoma; nonseminoma; seminoma; seminoma; spermatogenesis; infertility; filmfelter's syndrome; XX male; epididymitis; genital wart; germinal cell aplasia of the testis; cryptorchidism; varicocele; immotile cilia syndrome; viral orchitis; premature puberty; incomplete puberty; Kallman syndrome; Cushing's syndrome; hyperprolactinaemia; haemochromatosis; congenital adrenal hyperplasais, follicle stimulating hormone deficiency; granulomatous disease; PCR; primer; antibody; heavy chain; light chain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human G-protein coupled receptor HGPRBMY26 polypeptides and nucleic acids, useful for preventing, treating or ameliorating e.g. testicular disorder, choriocarcinoma, infertility, viral orchitis, or Cushing's
                                                                                                     Human anti-HGPRBMY26 antibody heavy chain PCR primer Hu VH-3 5'.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Barber LE;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to G-protein coupled receptor (GPCR), HGPRBMY14 and its corresponding nucleic acid sequence. HGPRBMY14 sequences are useful for preventing or treating a disorder directly linked to aberrant neuropeptide Y receptor activity or to aberrant DNA synthesis, an eating or appetite disorder, male reproductive disorder or proliferative disorder e.g., testicular cancer. These are useful for detecting a susceptibility to) a pathological condition. HGPRBMY14 is useful for
spermatogenesis, infertility, Klinefelter's syndrome, XX male, epididymitis, genital warts, germinal cell aplasia of the testis, cryptorchidism, varicocele, immotile cilia syndrome, viral orchitis, premature puberty; incomplete puberty, Kallman syndrome, Cushing's syndrome, hyperprolactinaemia, haemochromatosis, congenital adrenal hyperplasia, follicle stimulating hormone (FSH) deficiency and granulomatous disease. The present sequence is a PCR primer used in the isolation sequences encoding heavy or light chains (VH or VL) of anti-HGPRBMY26 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       G-protein coupled receptor; GPCR; HGPRBMY14; neuropeptide Y receptor; proliferative disorder; testicular cancer; NF-KB; disbetes mellitus; autoimmune disorder; male reproductive disorder; appetite disorder; VH; eating disorder; neurodegenerative disorder; human; PCR; primer; se.

ö
identifying its binding partners, including agonists and antagonists. Antagonists to the polypeptide is useful in treating a disorder related to aberrant NF-kB activity or a proliferative disorder. HGPRBMY14 DNA and protein are also useful in treating neurodegenerative or autoimmune disorders, or diabetes mellitus. The present sequence is a RT-PCR primer used for amplifying human HGPRBMY14 antibody VH gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a human chemokine betal (Ckbl) protein (I) comprising a deletion in amino acid residues from the amino terminus and/or carboxy terminus of the 31 residue amino acid sequence (S1, see ADD06466). (I) has anti-HIV, neuroprotective, antithyroid, antiarthritic, antirheumatic, immunosuppressive, noctropic, antianifammatory, antiathatic, antiallergic, osteophatic, nephrotrophic, tuberculostatic, virucide, antiatherosclerotic and antimicrobial activities. (I) is useful

for preventing infection, preferably viral (human immunodeficiency virus (HIV)) infection, in a cell, by contacting the cell with (I). (I) is also useful for treating a disease, such as HIV infection or immune disorders, haematopoietic disorders, autoimmune disorders multiple sclerosis, carve's disease, arthritis, rheumatoid arthritis, transplant rejection, Grave's disease, inflammatory disease, asthma, allergic disorders, inflammatory bowel disease, osteoarthritis, collitis, inflammatory kidney diseases, glomerulonephritis, infections, ustal infection, proliferative disorders or abherosclerosis, infection, viral infection, proliferative disorders or aberosclerosis, in an individual. (I) inhibits or abolishes the ability of HIV to bind to, viral infection, proliferative disorders or arberosclerosis, in an individual. (I) inhibits or abolishes the ability of HIV to bind to, viral sloacts a CCRS agonists or antagonists, stimulate chemotaxis of CCRS-expressing cells, inhibit CCRS ligand binding to a CCRS expressing cells, inhibit CCRS ingand binding to a CCRS molecule, or upregulate or downregulate CCRS expression. (I) is useful as an immunological probe for the differential identification of the tissues or cell-types. (I)-human serum albumin (HSA) fusion proceins are useful for diagnosing, treating and preventing various disorders in mammals, cell-types. (I)-human serum albumin (HSA) fusion proceins are useful for electrophoresis techniques, for raising antibodies, and to test the electrophoresis techniques, for raising antibodies, and to test the biological activities of the CKbl protein. (I)-HSA fusion protein portein portein cuseful for screening for molecules that bind to the CKbl protein portein portein cuseful for screening for molecules that bind to the CKbl protein portein portein portein cuseful the contact of th

The present invention relates to novel proteins and their coding sequences (ADC83405) encoding human transient receptor potential condences (ADC83400-ADC83405) encoding human transient receptor potential channels. The coding sequences are useful for preparing a medicament for preventing, treating or ameliorating a medical condition, such as renal disorders, a disorder related to abbarrant calcium regulation; neural disorders, various choroid plexus neoplasms, prion disorder; cerebellum disorders, various choroid plexus neoplasms, prion disorders; movement disorders, a disorder that maps to or is associated with chromosome locus 9421.11-21.31; amyotropic lateral calcionis, early onset pulverulent cataract; infantile nephronophthisis, hypomagnesemia with secondary hypocalcemia; osteoporosis; DNA-repair deficiencies; xeroderma pigmentosum; UV sensitivity; gamma irridation sensitivity; pyrimidine dimer sensitivity; chemical mutagenesis; Bloom's conditions involving increased levels of apurinic/apyrimidinic/abasic sites; disorders related to aberrant signal transduction; and disorders related to misregulation con this man evaruable from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                  useful in preventing, treating or ameliorating a medical condition, such as renal disorder, neural disorder e.g., Alzheimer's disease, or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Albumin fusion protein; therapeutic protein; HIV; osteoporosis; cancer;

The present invention relates to albumin fusion proteins comprising any of the therapeutic proteins listed in the specification, or their fragments or variants, and an albumin protein or its fragments or variants. The invention also discloses pharmaceutical compositions comprising the albumin fusion proteins, a kit comprising the albumin fusion proteins, a kit comprising the albumin patient, that is modulated for treating a disease or disorder in a patient, that compositions and methods of the invention are useful in variant. The compositions and methods of the invention are useful in such as HIV, osteoporosis, cancer, wounds, autoimmune diseases, cardiovascular diseases, hepatitis, multiple sclerosis, psoriasis, graftversus-host disease, stroke, atherosclerosis and inflammation. The
                                                                                                                                                                                                                                                                                                                                                                                      present sequence represents a PCR primer. Note: The present sequence is given in the Sequence listing but is not mentioned elsewhere in the specification. The present sequence given as SEQ ID No:38 in the Sequence

and polymucleotides encoding such proteins. Sequences of the invention are used to diagnose a pathological condition or a susceptibility to a medical condition in a subject. They are useful for preventing, treating, or ameliorating medical conditions such as immune condition or disorders, cancitions, female reproductive disorders, male reproductive disorders, orally disorders, posticular disorders, male reproductive disorders, cancer, hepatic disorders, pulmonary disorders, metabolic disorders, renal disorders, pulmonary disorders, metabolic disorders, renal disorders, pulmonary disorders, metabolic disorders, renal disorders, inflammatory diseases inflammatory diseases where proteases are either directly or indirectly involved in disease progression, sclerosis, amyotrophic lateral sclerosis or a disorder associated with aberrations of chromosome 2432 MMP-29 sequences are also useful in gene therapy. The present sequence is human MMP-29 antibody VH domain amplifying PCR primer. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

        The present invention describes a combination of apparatus (1)

Comprising: (a) an addressable collection of binding sites; and (b)

Software comprising instructions for pattern recognition and/or an imager

Comprises: (a) capture agents, where each capture agent is preselected to

specifically bind to a pre-selected tags; and (b) tagged reagents, each

Comprises a molecule and erage; where each locus in the

comprises a molecule and a tags, each tag is pre-selected to specifically

bind to a capture agent, where each agis pre-selected to specifically

comprises a molecule and a tags, each tag is bound to a capture agent,

bind to a capture agent, where each tags is bound to a capture agent,

comprises a molecule and a tag, each tag is bound to a capture agent,

comprises a tagged reagent with the capture agent, where

comprises a capture argued reagent with the capture agent, where

comprises a teach locus comprises the same pre-selected tag. Also

described: (1) a system for profiling samples; (2) a method for profiling

che database produced by the method of profiling a sample;

comprising capture system that displays a collection of binding

comprising capture agents bound to a solid support and tagged reagents;

and (6) a method for screening samples. The combination (1) is useful for

comprising a sample. The present sequence is used in the exemplification

ö The present invention provides novel polynucleotides encoding HEAG2 (human potassium channel) polypeptides, fragments and homologues thereof. The invention is useful for producing three-dimensional representation of a molecule or molecular complex comprising the structural coordinates of the PAS domain of HEAG2. The invention is also useful for treating conditions such as disorder associated with aberrant amygdala function, fear, neurodevelopmental psychopathological disorders, schizophrenia, autism, aggression, memory, emotional disorders, aberrant hypothalamus function, leptin receptor disorders, food intake disorders, energy-expenditure disorders, bone canceling functions, neurophysin-related disorders, bone disorders, bone remodeling disease, appetite suppression and motion sickness. The present sequence is PCR primer used to amplify human HEAG2 VH domain. This sequence is used in the exemplification of Computer for producing three-dimensional representation of molecule o molecular complex of PAS domain of potassium channel protein, useful designing compounds as potential modulators for treatment of Gaps ; 0 albumin fusion protein; albumin activity; human serum albumin; serum osmotic pressure; shelf-life; stability; antidiabetic; gene therapy; diabetes mellitus; PCR; primer; ss; human. 0.5%; Score 17.2; DB 1; Length 23; 86.4%; Pred.                                                                                                                                                                                                      Rosen CA,
         ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a PCR primer which was used in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New albumin fusion protein, useful for preparing a composition for treating diabetes mellitus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of PCR primer Hu VH3-5' for the human heavy chain variable region (VH). A set of primer sequences ADF18313-ADF18268 was used in the identification and cloning of VH and VL domains from antibody-expressing cell lines. The invention relates to antibodies that specifically bind to TL5. These are used in the diagnosis, prevention or reatment of a disease or disorder such as an autoimmune disease, transplant rejection, cancer (especially colon cancer, lymphadenopathy, transplant rejection, cancer (especially colon cancer, breast cancer, und Kaposi's sarcoma), an immunodeficiency syndrome, or an inflammatory disease such as asthma or allergy.
                                                                                                                                                                                                                                                                                                                                                                                                       New antibody that specifically bind to TL5, useful for diagnosing, preventing, treating or ameliorating diseases (e.g. cancer, autoimmune disease, inflammation or transplant rejection), and in immunophenotyping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TR2; orphan nuclear receptor; cytostatic; immunosuppressive; virucide; immunostimulant; dermatological; antiinflammatory; antirheumatic; antiathritic; neuroprotective; muscular; antiasthmatic; antiallergic;

The invention relates to an isolated antibody (A1) that specifically binds orphan nuclear receptor TR2 or that competitively inhibits the binding of an antibody to TR2. The antibody and methods are useful in inhibiting the growth of or K11ling orphan nuclear receptor TR2 expressing cells and treating, preventing or ameliorating a disease or disorder selected from an autoimmune disease, graft-versus-host disease, transplant rejection, cancer, herpes simplex virus infection and an immunodeficiency, e.g. lupus erythematous, rheumatoid arthritis, multiple sollerosis, mysathenia gravis, or inflammatory disorders (e.g. asthma or allergies). The antibody may also be used in immunoassays for qualitatively and quantitatively measuring levels of TR2 polypeptides in biological samples, in immunophenotyphing of cells lines and biological samples, or in epitope mapping. Sequences ACFS8401-436 represent PCR primers for amplifying the VH and VL domains of an anti-TR2 antibody
                                                                                                                                                                                                                                                                                               New antibodies that specifically bind to orphan nuclear receptor useful for diagnosing, preventing, treating or ameliorating diseases, e.g. cancer, autoimmune diseases, inflammation or viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GMAD; VH; CDR; complementarity determining region; VL; scFv; single chain antibody; antidiabetic; type II diabetes; human; PCR;

The invention describes a new isolated nucleic acid molecule comprising:

a polynucleotide fragment or complement of the cDNA sequence; a performance of the cDNA sequence; a comprising nucleotides described a comprising nucleotides 4-1404 or 1-1404 of the polynucleotide sequence encoding a polypeptide, or its fragment, domain or epitope. The polynucleotide sequence does not thyridise to a nucleotide sequence having only A or I residues. The polypeptide comprises a fully defined 335-amino acid sequence, or its amino acids 2-335 without the start methionine or 1-335 including the start methionine or 1-335 including the start methionine or 1-335 including the start methionine acitivity, a disorder associated with deficiencies in methionine activity, a disorder associated with hypermethionine activity, a confidence of paramethy activity, a disorder associated with hypermethionine activity, a disorder associated with hypermethionine activity, a confidence of the colon or ovarian cancer. This sequence of represents a primer used to isolate DNA encoding a human heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel polynucleotide useful for detecting single nucleotide polymorphisms
                              New nucleic acid encoding a human methionine aminopeptidase, useful for preparing a composition for diagnosing, preventing or treating e.g., neural, metabolic, vascular, immune or inflammatory disorders or ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               variable domain of antibodies directed against novel human methionine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                  The invention relates to a novel antibody that specifically binds to a GMAD polypeptide comprising a first amino acid sequence that is at least 95% identical to a second amino acid sequence of a VH CDR (complementarity determining region) or VL CDR of an scPv (single chain antibody molecule). The antibody of the invention demonstrates antidiabetic activity and may be useful for diagnosing, monitoring, treating, preventing or ameliorating type II diabetes. The current sequence is that of the PCR primer which was used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Naglich J;

                                                                                                                                                                                                                                                                                                                     굄
                       The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1202 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene is neeful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism one of the invention.
                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human growth factor; epidermal growth factor-8; BGS-8; immunosuppressive; haemostatic; grasecological; antiinfertility; hepatotropic; cardiant; cytostatic; BGF agonist; gene therapy; immune disorder; cardiant; haematopoietic disorder; reproductive disorder; reproductive disorder; hepatic disorder; cardiovascular disorder; proliferative disorder; cancer; aberrant growth factor regulation; wound repair; angiogenesis regulation; epithelial cell growth regulation; epidermal cell growth regulation; EGF receptor; proliferative condition; lymph node; uterus; pancreas; liver; heart; stomach; lung; human; PCR;

This invention relates to a novel DNA sequence encoding a human growth factor with homology to epidermal growth factor-8 (BGS-8). The invention may be useful for the development of compounds with an immunosuppressive, haemostatic, gynaecological, antiinfertility, hepatotropic, cardiant or cytostatic activity which act as BGF agonists. In addition the genetic acquences of the invention may be useful for gene therapy. The invention may be useful for preventing, treating or ameliorating medical conditions, such as immune disorder, haematopoietic disorder, a hepatic disorder, a male or female reproductive disorder, a hepatic disorder, a cardiovascular disorder, a proliferative disorder, cancer, or a disorder related to aberrant growth factor regulation, wound repair, a disorder related to aberrant growth factor regulation, wound repair, or regulation, epithelial or epidermal call growth regulation or the BGF receptor, or a proliferative condition involving one or more lymph node, uterus, liver, heart, stomach, lung and pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to fusion proteins comprising human serum albumin (ADH21530) and a therapeutic polypeptide such as a therapeutic protein, antibody or peptide or their variants or fragments. The therapeutic protein protein may be fused to the N-terminus, the C-terminus or both termin of albumin via a linker. The albumin component of the fusion proteins or prolongs the shelf-life and the in vitro and vivo biological activity of the proteins compared with those of the corresponding therapeutic proteins on their own. The invention also relates to nucleic acids of albumin fusion proteins, vectors and host cells comprising an albumin fusion protein, the method of extending the shelf-life of a long and protein, the method of extending the shelf-life of a cherapeutic protein, the method of extending the shelf-life of a cherapeutic protein protein with albumin fusion proteins may be used using an albumin fusion protein in the albumin fusion proteins may be used in the treatment of metabolic/endocrine disorders, diabetes and diabetes. The albumin fusion proteins may be used to treat type 1 and type 2 diabetes, hyperglycaemia, neural disorders (especially heart disease, renal disorders and obesity. The proteins may also be used in a method of maintaining a basal glucose level in a gating and in a method for losing weight. The present sequence is
New albumin fusion protein, useful for preparing a composition for
                                                                                                                                                                             Example 91; SEQ ID NO 344; 1086pp; English.
                                                       treating diabetes mellitus
```

New TRP-PLIK2 nucleic acid and its splice variants, useful for manufacturing a medicament for preventing, treating or ameliorating a medical condition, e.g. renal, inflammatory or reproductive disorders.

Example 33; SEQ ID NO 274; 457pp; English.

This invention relates to a novel isolated human TRP-PLIK2 (transient receptor potential channel) nucleic acid sequence and the protein encoded by it. The invention may be useful for the development of compounds with an antitinfilammatory, graaecological, immunomodulatory, cardiant, crytostatic, neuroprotective, antiviral or anti-HIV activity. In addition, the DNA sequence may be useful for gene therapy. The invention may therefore be useful for manufacturing a medicalement for preventing, treating or ameliorating a medical condition, for example immune disorders, hemptopietic disorders, inflammatory disorders, renal disorders, reproductive disorders, hepatic disorders, a disorder related consorder related consorder related to chromosome 9g21.2-22 aberrations, testicular cancer, diseases related to chromosome 9g21.2-22 aberrations, amyotrophic lateral scalerosis with frontotemporal dementia, early-onset curvor protein a familial hamophagocytic lymphonistiocytosis, amyotrophic ataract, infanilial hamophagocytic lymphonistiocytosis, neuron degeneration, neurogenic inflammation, visual defects, hearing disorder, pain, cancer, hypertension, oratiovascular diseases, diseases associated with disturbances in Calcium homeostasis including costeoporosis, hypercalcular, stone disease, chronic renal failure, immuno-compromised conditions, HIV infection, disorders associated with aberrant compromised conditions, HIV infection, disorders associated with aberrant capoptosis regulation, disorders associated with aberrant capoptosis regulation, disorders associated with destrable.

C decreasing or increasing IRB activity would be therapeutically desirable and disorders in which

The invention relates to an isolated polynuclectide encoding a first antibody at least 91.00% identical to a second antibody comprising an emino acid sequence selected from at least one, two or three CDR region(s) of a VH or VL domain where the first antibody in the CDR immunospecifically inhibits a VEGF-2 polypeptide. The isolated polynuclectide is useful in diagnosing, treating, preventing, prognosing, ameliorating or monitoring diseases associated with aberrant VEGF-2 or VEGF-2 receptor expression or lack of VEGF-2 or VEGF-2 receptor function, csuch as cancer and other proliferative disorders (e.g. cerebral disorders (arrhythmias), cerebroacular disorders (e.g. cerebral anoxia), inflammatory diseases, infectious diseases, autoimmune diseases (e.g. rheumatoid arthritis, Systemic Lupus Erythematosus, allergies), diabetic retinopathy or psoriasis. The polynucleotide, polypeptide and antibodies may also be used to stimulate angiogenesis, wound healing, and promoting vascular tissue repair. The polynucleotide and polypeptide may also be used for in vitro purposes related to scientific research, synthesis of DNA and manufacture of DNA vectors, and for the production of diagnostics and therapeutics to treat human diseases. This polynucleotide sequence represents a PCR primer used in the exemplification of the invention

Novel NF-kappaB-associated polypeptides and polynucleotides useful for diagnosing, treating and preventing cancer, hepatic disorders, aberrant apoptosis, viral infections, autoimmune disorders, asthma and stroke.

Example 33; Page 407; 608pp; English.

The present invention relates to the isolation of human nuclear factorkappaB (NF-kappaB) associated polypeptides and polynucleotides. The NFkappaB associated polypeptide and polynucleotide sequences are useful for
preventing, treating or ameliorating various disorders including immune
disorders, inflammatory disorders, cancers, disorders relating to
aberrant apoptosis, hepatic disorders, Hodgkin's lymphomas,
hematopoietic tumours, hyper-IgM syndromes, hypohidrotic ectodermal
dysplasia, X-linked anhidrotic ectodermal dysplasia, immunodeficiency, al
immunodeficiency virus (HIV), human T-cell lymphotropic virus (HTLV),
hepatitis B, hepatitis C, Epstein Barr virus (EBN), influenza),
rheumatoid arthritis, inflammatory bowel disease, colitis, asthma,
cheumatoid arthritis, activity disorders related to aberrant acute phase
contemporate immune activity, disorders related to aberrant acute phase
contemporate immune activity, disorders related to aberrant signal
chapter immune activity, disorders related to aberrant signal
chapter immune activity, disorders related to aberrant signal
chapter and phyperpoliferative disorders related to aberrant signal
chapters and phyperpoliferative disorders diseases of the pancreas disorders (e.g. Huntington's chorea), Turner's syndrome, bacterial infections, cardiovascular disorders, infertility, psoriasis and haemolytic anaemia. The present sequence represents a PCR primer used in the examples of the present invention

The present invention relates to the isolation of a novel member of the immunoglobulin (Ig) superfamily, human antigen presenting cell expression (APEXX4, and variants (APEXX401) thereof.

The polypeptides of the invention are useful for treating, preventing or ameliorating medical conditions, such as immunological disorders (e.g. rheumatoid arthritis, inflammatory bowel disease, sepsis, acne or host versus graft disease), haematopoietic disorders, disorders related to aberrant leukcoyre proliferation, differentiation, migration or activation, disorders related to aberrant activation of natural killer cells, disorders of the spleen, inflammatory disorders, and proliferative disorders (e.g. neoplasms). APEX4, APEX4v1 and APEXsv1 polypeptides, and proliferation, migration, migration and activation in various cells, tissues and organisms. The polynucleotides sequences are are useful in Chromosome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New APEX (antigen presenting cell expression) 4 and APEX4v1 proteins and nucleic acids, useful for treating or preventing e.g. immunological disorders, hematopoeitic and/or proliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   organisms. The polynucleotides sequences are are useful in chromosome identification, chromosome mapping, as molecular weight markers, and in gene therapy. The present sequence represents a PCR primer used in the examples of the present invention
                                                                                                                                                                                                                                     PCR primer #3 for DNA encoding VH domain of anti-APEX4 human antibody.
                                                                                                                                                                                                                                                                        Human; immunoglobulin superfamily; Ig; APEX4; sepsis; acne; antigen presenting cell expression 4; immunological disorder; rheumatoid arthritis; inflammatory bowel disease; activation; host-versus-graft disease; haematopoietic disorder; migration; leukocyte proliferation; differentiation; T-cell activation; B-cell activation; natural killar cell; splean disorder; inflammatory disorder; proliferative disorder; neoplasm; immunosuppressive; antinflammatory; antiarthritis; cytostatic;

The invention comprises the amino acid and coding sequence of B7-related (BSL2) fusion proteins. The B7-related fusion proteins of the invention are useful for modulating the activation of immune or inflammatory response cells (e.g. T cells). The B7-related fusion proteins are useful for treating or preventing: transplantation rejection; graft versus host disease; asthma; chronic obstructive pulmonary disease; cancers; viral infections (e.g. HIV, herpes or encephalitis); and autoimmune disease (e.g. rheumatoid arthritis, multiple sclerosis or psoriasis). The present DNA sequence represents a PCR primer that was used to amplify the DNA encoding the variable domain of an antibody that is specific for a B7-

The invention relates to an albumin fusion protein comprising a therapeutic protein.X, and albumin, its variant or fragment. The albumin therapeutic protein.X and albumin, its variant or fragment. The albumin fusion protein to regament, L is a peptide linker and R2 is albumin. The albumin fusion protein is useful for treating a disease or disorder that is modulated by therapeutic protein.X (claimed), such as cancer; infections (bacterial, viral, fungal, parasitic); or immune (AIDS, asthma); hematopoietic (leukemia, sepsis); reproductive (cystic fibrosis, endometriosis); musculoskeletal (osteoporosis, osteoarthritis); cardiovascular (congestive heart failure, atherosclerosis); neural/sensory (ataxia, attention deficit disorders, autism); respiratory (emphysema, bronchitis); endocrine (goiter, glomerulonephritis); chiquestive (ulcer, cirrhosis); or connective/epithelial (lupus, keloids) disorders. Sequences ACC78589-624 represent PCR primers for amplifying human VH and VL domains, that can be used to create multifusion proteins
                                                                         Albumin, HA; cytostatic; antibacterial; virucide; fungicide; anti-HIV; antiasthmatic; osteopathic; antiarthritic; antiinflammatory; nootropic; neuroprotective; anti-thyroid; anti-ulcer; hepatotropic; vulnerary; protein therapy; growth hormone; hGH; VL; VH; PCR; primer; ss.

The invention relates to a composition comprising an antisense oligomucleotide directed against vascular endothelial growth factor (VEGF). The antisense oligomucleotide is useful for preparing a composition treating cancer, neoplastic proliferation, abnormal cellular proliferation and preventing angiogenesis. The present sequence is a proliferation and preventing angiogenesis. The present sequence is a carearse transcriptace (RT)-PCR primer for a VEGF or related gene, used to clone the coding region for expression in tumour cell lines. The cell lines were used to test prospective antisense oligonucleotides
                                                                                                                                                                                                                                                                                                                                              New composition comprising an antisense oligonucleotide directed against vascular endothelial growth factor, useful for preparing a composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; G-protein coupled receptor; HGPRBMY39; cancer; PCR; primer; male reproductive disorder; testicular disorder; immune disorder; inflammatory disorder; developmental disorder; leukaemia; VH; bone marrow disorder; testicular cancer; proliferative disorder; neural disorder; Alzheimer's disease; prion disorder; antibody; bone metabolism disorder; heavy chain variable region.

```
The invention relates to. an isolated nucleic acid encoding a human G-
protein coupled receptor HGPRBMY39 (or its fragment domain or epitope),

tis complement or a polynucleotide capable of hybridising under stringent

conditions to it. Also included are a HGPRBMY39 recombinant vector, a

conditions to it. Also included are a HGPRBMY39 recombinant vector, a

recombinant host cell comprising the vector sequences (used to express

cond make the protein), an isolated HGPRBMY39 polypeptide, and an anti-
HGPRBMY39 antibody. The HGPRBMY39 polypeptide, and an anti-
HGPRBMY39 antibody. The HGPRBMY39 polypeptide is

cuseful for preventing, treating or ameliorating e.g. a (male)

reproductive disorder; a testicular disorder or cancer; a disorder

cuseful for preventing, treating or ameliorating or encare; a clasorder

cuseful for preventing, resticular disorder related to aberrant G-

protein coupled receptor dependent phosphatidylinositol-calcium

controlling, a disorder related to aberrant G-

proinflammatory signal; aberrant N-formyl peptide signalling; aberrant

cuseful activation; a disorder associated with below normal neutrophil activation;

a disorder related to aberrant intracellular and/or extracellular

coxidation states; a disorder related to aberrant superoxide generation;

coxidation states; a disorder related to aberrant neutrophil activation;

a disorder related to aberrant intracellular and disorders;

coxidation states; a disorder related to aberrant meutrophil activation;

coxidation states; a disorder related to aberrant meutrophil activation;

coxidation states; a disorder related to aberrant meutrophil activation;

coxidation states; a disorder related to aberrant meutrophil activation;

coxidation states; a disorder related to aberrant meutrophil activation;

coxidation states; a disorder related to aberrant meutrophil activation;

coxidation states; a disorder related to aberrant meutrophil activation;

coxidation states; a disorder related to aberrant superoxide generation;

coxidation states; a 
                                                                                                                                                                                                             New human G-protein coupled receptor, HGPRBMY39, useful for treating or preventing e.g. immune, inflammatory, developmental, proliferative, neural, reproductive, bone marrow or prion disorders.
                                                                                      Gopal S, Mintier G, Feder JN;
                                                                                                                                                                                                                                                                                                                                                  Example 37; Page 313; 359pp; English.

The invention relates to an isolated human potassium channel alpha
subunit, K+alphaMZ polypeptide. The K+alphaMZ polypeptide and
subunit, K+alphaMZ polypeptide. The K+alphaMZ polypeptide and
colymuclostide are useful for diagnosing, preventing, treating or
ameliorating a medical condition, such as a neural disorder, an immune
disorder (e.g. rheumatoid arthritis, AIDS, asthma, leukemia, psoriasis or
centropenia), a disorder related to aberrant potassium regulation,
metabolic disorder (e.g. diabetes, pancreatitis, osteoporosis or
hypertriglyceridemia), a reproductive disorder, a renal disorder, a male
creproductive disorder (e.g. infertility, testicular cancer or viral
orchitis), a memory disorder, an obsersative/compulsive disorder, an
addiction, a disorder related to aberrant dopamine or serotonin
regulation, desphoria, depression, irritability, anxiety, or depression,

The invention relates to an isolated human G-protein coupled receptor, HGPRBMY30 polypeptide or a sequence having 95% identity to the above mentioned sequences. (I) is useful for preventing or treating a medical condition, selected from an immune disorder; a cardiovascular disorder; an inflammatory disorder in which G-protein coupled receptors are either disorder; a reproductive disorder; a metabolic disorder; a metabolic disorder; a metabolic disorder; an eneral disorder; a male reproductive disorder; certicular cancer; a neural disorder; and redoctine disorder; prognosing, preventing, and/or ameliorating the diseases such as hematopoletic and pulmonary disorders, Alzheimer's, Parkinson's diseases, diabetes, dwarfism, color blindness, retinal pigmentosa, asthma, expression, schizophrenia, sleeplessness, hypertension, anxiety, stress, renal failure, acute heart failure, hypotension, obesity, anorexia, HIV infections, osteoporosis, angina pectoris, and myocardial infarction. (I) and (II) are useful for modulating signal transduction activity. (I) and (II) are useful for modulating signal transduction activity. (I) and (II) are useful for modulating signal transduction activity. (I) and (II) are useful for modulating signal transduction activity. (I) and (II) are useful for modulating signal transduction of body healpht, weight, hair color, eye color, skin, percentage of dipose tissue, pigmentation, size and shape, to change a mammal's mental state or physical state by influencing biorhythms, caricadic rhythms, corpaspillities, hormonal or endocrine levels, appetite, libido, memory, stress, or other cognitive qualities. This sequence corresponds to a porner. primer for the var HGPRBMY30 protein

New antibody that specifically binds to a chemokine beta-4 polypeptide, useful for diagnosing, treating, preventing or ameliorating psoriasis, rheumatoid arthritis, systemic lupus erythematosus, cancer, HIV infection and wounds

Example 2; SEQ ID NO 39; 181pp; English.

The present invention describes an antibody (I) that specifically binds to a chemokine beta-4 (CK-B4) polypeptide. Where (I) comprises a first amino acid sequence at least 95% identical to a second amino acid sequence comprising a VH complementarity determining region (CDR) or VL cDR of any of the single chain Fvs (scFvs) from any of 17 fully defined sequences of 245-253 amino acids (ADB83861 to ADB8387). Also described: (I) a kit comprising the isolated nucleic acid molecule encoding (I); (3) a vector comprising the isolated nucleic acid of (2); (4) a host coll comprising the vector of (3); (5) a cell line engineered to express (I); (6) an antibody that binds the same epitope as (I); (7) an antibody that competitively inhibits the binding (I) to a CK-B4 polypeptide; (8) a method for detecting aberrant expression of CK-B4 polypeptide; (8) a method for detecting aberrant expression of CK-B4 polypeptide; (8) a sasaying the level of CK-B4 polypeptide expression in a first biological sample of an individual using at least one of (I), and comparing the standard level of CK-B4 polypeptide expression or level of CK-B4 polypeptide in a second, normal biological sample, where an increase or decrease in the assayed level of CK-B4 polypeptide in the first biological sample compared to the standard level is indicative of biological sample. diagnosing, treating, preventing or ameliorating psoriasis, dermatitis or an autoimmune disease such as rheumatoid arthritis, systemic lupus erythematosus and autoimmune encephalitis. They can also be used in administering (I) to the animal. (I) has antipsoriatic, dermatological, antinflammatory, immunosuppressive, antirheumatic, antiarthritic, cerebroprotective, cytostatic, anti-HIV and vulnerary activities. The methods and compositions of the present invention are useful for cancer, HIV infection, wounds and inflammatory disorders. The present sequence is used in the exemplification of the present invention. aberrant expression, and (9) a method of treating, preventing or ameliorating psoriasis, dermatitis or an autoimmune disease, comp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel antibody specifically binding neurokinin B. An antibody of the invention has hypotensive, and gynaecological activity, and may have a use in gene therapy. The antibody is useful for preparing a composition for treating or preventing hypertension or precedence; and the present sequence is used in the exemplification of the

The invention relates to an isolated nucleic acid molecule comprises a polynucleotide encoding the full-length human leucine-rich repeat cardiac receptor-1 (HLLRCR-1) protein appearing as ADG75441and ADG75443. Also included are a recombinant vector comprising the isolated nucleic acid molecule, a recombinant vector comprising the vector sequences, the isolated polypeptide, an isolated mithody that binds per a pecifically to the isolated polypeptide, making an isolated polypeptide, and recovering the polypeptide, making an isolated polypeptide or a pecifically to the isolated polypeptide, making an isolated polypeptide or deveraining the polypeptide, making an pathological condition or a susceptibility to a pathological condition in a subject (by determining the presence or absence of a mutation in the polymelecule, and diagnosing a pathological condition or a susceptibility to a pathological condition or a subsence of the mutation) and preventing, treating or ameliorating a pathological condition or a beence of the mutation) and preventing, treating or ameliorating a cardiovascular medical condition by administering a polypeptide or its modulator to a disorder, neural disorder, reproductive disorder, neural disorder, reproductive disorder, neural disorder, reproductive disorder, neural disorder, related proliferated condition of the lung, colon cancer, related proliferated condition of the lung, colon cancer, related proliferated condition of the colon, memory, establishment of short term memory, establishment of short term memory, establishment of short term memory, establishment of long term memory, dementia, complition, learning, development of long term memory, desorders associated with heurom attrition, Alzheimer's disorder short accompany severe trauma to the brain, disorder sasociated with the brain, particularly memory disorders, movement (ansociated with aberrant signal transduction, or aberrant call-to-call continuication, aberrant signal transduction, or aberrant call-to-carciniment (many other disea specification). The invention provides human sequence that encodes a leucine-rich repeat containing protein with homology to the leucine-rich repeat containing protein known as NoGo receptor that is primarily expressed in the brain and is thought to be responsible for modulating neurite growth. The present sequence is a PCR primer used to isolate nucleic acid encoding a VH or VL chain of an anti-HLLRCR-1 antibody. Example 34; SEQ ID NO 55; 164pp; English.

Sequence 23 BP; 3 A; 3 C; 12 G; 5 T; 0 U; 0 Other;

Novel isolated human G-protein chemokine receptor HSATU68 polypeptide, useful for preventing, treating or ameliorating medical conditions such as leukemia.

Example 13; SEQ ID NO 15; 168pp; English.

This invention relates to a novel isolated human G-protein chemokine receptor polypeptide (HSATU68) and the DNA sequence which encodes it. The receptor polypeptide (HSATU68) and the DNA sequence which encodes it. The invention may be useful for the development of compounds with a cytostatic, anti-HTV, anti-inflammacrory, anti-diabetic, immunosuppressive, cytostatic, anti-HTV, anti-inflammacrory, anti-diabetic, immunosuppressive, contropic or neuroprotective activity which act as agonists of the receptor of the invention can susceptibility to a pathological condition and for developing methods for treating, preventing diseases, disorders or conditions associated with aberrant expression and/or activity of the receptor of the invention such as infectious diseases which includes silicosis, sarcoidesis. The captractory syndrome (ARDS), hyperproliferative disorders such as acute colludowed lymphoblastic leukaemia, brain tumours, breast cancer, Kaposi's sarcoma, Hodgrin's sarcoma, myeloid leukaemia and urethral cancer, capastrointestinal disorders such as gastric reflux and peptic consophagitis, liver disorders such as gastric reflux and peptic consophagitis, liver disorders such as such as neoplasms or pancreas and islet cell tumours, gallbladder diseases such as bile duct tumour, chearing such as cardiac oedema, pulmonary heart disease, reproductive disorders such as cardiac oedema, pulmonary heart disease, uch as diabetes consolative, diabetes insipidus, for stimulating B-cell responsivenes to boost immunoresponsiveness emong individuals having an acquired loss of B

conditions antiparkinsonian, nootropic, transqualizer, antiaddictive, anabolic, antiparkinsonian, nootropic, transquilizer, antiaddictive, anabolic, antiparkinsonian, nootropic, transquilizer, antiaddictive, and hyponotic. The human neurotransmitter transporter nucleic acid can be used in gene therapy to treat disorders. The composition and methods are useful in diagnosing, preventing or traating a pathologic or medical condition selected from a disorder related to aberrant neurotransmitter transport; affective disorders, immune-related disorders, neuropathic pain, obesity, anorexia, bulimia, Parkinson's disease, dementias, behavioral disorders; memory disorders; organitive disorders, neuropathic pain, obesity, anorexia, bulimia, Parkinson's disease, dementias, behavioral calsorders; memory disorders; organitive disorders associated with aberrant serotonin expression and/or activity; anxiety, fear, depression, sleep, pain, disorders associated with aberrant maintenance of an attentive or alert states attention deficit disorders affecting the ceffecting the release of neurotransmitters such as affecting the release of neurotransmitters such as affecting the establishment of long term potentiation; circadian rhythm disorders; disorders; neuronal confers neuronal confers neuronal caramisation system disorders, and pain. This polynucleotide sequence represents a primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
condition; and methods of diagnosing a
